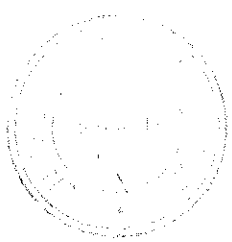
ПРИЛОЖЕНИЕ № 6

КЪМ ДОГОВОР С ПРЕДМЕТ: „ПОДМЯНА НА МАСЛОНАПЪЛНЕНА КАБЕЛНА ЕЛЕКТРОПРОВОДНА ЛИНИЯ 110 KV „ДРАГАЛЕВЦИ“ - ЕЛЕМЕНТ ОТ КРИТИЧНАТА ИНФРАСТРУКТУРА НА РАЗПРЕДЕЛИТЕЛНАТА МРЕЖА 110 KV НА ГРАД СОФИЯ“

Приложение № 1 към Предложение за изпълнение на поръчката – Заверени копия на каталози на предлаганите материали, апаратура, оборудване и съоръжения

ДЗЗД „ЕИК ДРАГАЛЕВЦИ" Пловдив



Приложение № 1.1 Заверено копие на каталог на Ограничител на пренапрежение (вентилни отводи) за нова КЕЛ 110 kV - 1 комплект (за преходен портал „КЕЛ - ВЕЛ“)

ДЗЗД „ЕИК ДРАГАЛЕВ“ Пловдив

Zinc Oxide Surge Arrester PEXLIM P-X

Protection of switchgear, transformers and other equipment in high voltage systems against atmospheric and switching overvoltages.
- in areas with very high lightning intensity
- where grounding or shielding conditions are poor or incomplete
- for important installations
- where energy requirements are very high (e.g. very long lines, capacitor protection).

Superior where low weight, reduced clearances, flexible mounting, non-fragility and additional personnel safety is required.

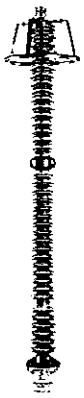
Major component in PEXLINK™ concept for transmission line protection.

Other data can be ordered on request. Please contact your local sales representative.

Brief performance data

Arrester classification as per IEC 60099-4 Ed 3.0	Station SH
Arrester classification as per IEEE Std C62.11-2012	Station
System voltages (U_s)	52 - 420 kV
Rated voltages (U_r)	42 - 360 kV
Nominal discharge current (IEC)	20 kA_{peak}
Lightning impulse classifying current (ANSI/IEEE)	10-15 kA_{peak}
Charge, energy and current withstands:	
Repetitive charge transfer rating, Q_{rs} (IEC)	3.2 C
Thermal energy rating, W_{th} (IEC)	11 kJ/kV (U_r)
Single impulse energy capability (2 ms to 4 ms impulse)	7.0 kJ/kV (U_r)
Discharge current withstand strength:	
High current 4/10 µs	100 kA_{peak}
Low current 2000 µs, (based on Q_{rs})	1.600 A_{peak}
Energy class as per IEEE standard (switching surge energy rating)	G
Single-impulse withstand rating as per IEEE standard	3.2 C
Repetitive charge transfer test value - sample tests on all manufactured block batches	4.0 C
Short-circuit/Pressure relief capability	65 $kA_{rms\,sym}$
Mechanical strength:	
Specified long-term load (SLL)	2.500 Nm
Specified short-term load (SSL)	4.000 Nm
Service conditions:	
Ambient temperature	-50 °C to +45 °C
Design altitude	max. 1000 m
Frequency	15 - 62 Hz
Line discharge class (as per IEC60099-4, Ed. 2.2)	Class 4

Further data according to the IEEE standard can be supplied on request



PEXLIM P-X
Guaranteed protective data 24 - 145 kV

[1] The continuous operating voltages U_c (as per IEC) and MCOV (as per IEEE) differ only due to deviations in type test procedures.
U_c has to be considered only when the actual system voltage is higher than U_s is indicated.
Any deviation with U_c higher than or equal to the actual system voltage @ MCOT by 1% can be selected.

[2] With one duty cycle at the thermal energy rating of 11 kJ/kV (U_r)

[3] Accepted for system voltages ≥ 15 kV or below can be supplied on request, when the order also includes arresters for higher system voltages.

Arresters with lower or higher rated voltages may be available on request for special applications.

Each crate contains a certain number of arrester units and accessories for assembly and erection. A packing list is attached externally on each crate.

Each separate crate is numbered and the numbers of all crates and their contents are listed in the shipping specification. ABB reserves the right to pack arresters in the most effective/economic combination. Alternate or non-standard crates may involve additional charges.

The table above is to be considered an approximation and specific data for deliveries may differ from the values given.

SUMMARY OF CUSTOMER WITNESS TESTS

Routine test requirements

The minimum requirements for routine tests on surge arresters are specified by IEC and IEEE. The tests performed by ABB fulfils or exceeds the requirements according to IEC 60099-4 or IEEE C62.11, as applicable for a specific order.

The routine tests performed by ABB comprise the following, as applicable:

- Residual voltage (Discharge voltage) at 10 kA (8/20μs) is individually measured on each MO resistor. The residual voltage of the complete arrester is taken as the sum of the residual voltages of the MO resistors in series.
- Tightness (Seal) check on arresters with hollow insulators having enclosed gas volume and separate sealing system is made on each unit in a pass/no-pass test. Maximum permissible seal leak rate is 0.0001 mbarl/sec at a pressure difference of 0.1 MPa.
- Reference voltage (Power frequency resistive current) is measured on each unit.
- After the application of at least rated voltage on each unit for a minimum of 10 seconds, the test voltage is decreased to 0.9 times rated voltage of the unit (being a higher voltage stress than required by IEC or IEEE) . At this voltage each unit is checked to have a steady partial discharge level less than 5pC.
- Power losses are measured at continuous operating voltage on each unit.
- Grading current is measured at continuous operating voltage on each unit.

Witnessing of routine tests

ABB accepts inspection and witnessing of these routine tests by Final Customer, Consultant or Purchaser, provided this is undertaken at the time of production and in accordance with our planned schedule. However, unless an extended visit is planned, not all tests can usually be witnessed for practical reasons. For example, the Residual Voltage (Discharge Voltage) test is performed during daily production of the MO resistors, which can occur a significant time before their assembly into the arresters.

If no Inspector is available at the time for the tests, we reserve the right to perform the tests according to our planned schedule and present the test report to the Inspector.

Acceptance tests are not considered necessary nor value-adding to secure the performance of ABB surge arresters due to the extensive testing program already undertaken by ABB (type, routine and sample). Consequently, acceptance tests are not performed unless specifically agreed upon in advance. Unless otherwise agreed, **customer witness of tests** on surge arresters from a specific order are hence limited to the following repeated electrical tests from the above list, performed on an agreed number (maximum 10%) of samples from the actual order, with all testing made on individual units of the arrester:

- Reference voltage
- Partial discharge
- Power losses
- Grading current

During customer visits, we welcome the opportunity to provide a tour of our facilities and, if possible, show the production of similar equipment from other customer orders.

High Voltage Surge Arresters
Buyer´s Guide

Table of contents

Safe, secure and economic supply of electricity — with ABB surge arresters

ABB surge arresters are the primary protection against atmospheric and switching overvoltages. They are generally connected in parallel with the equipment to be protected to divert the surge current. The active elements (MO resistors) of ABB surge arresters are manufactured using a highly non-linear ceramic resistor material, composed primarily of zinc oxide mixed with other metal oxides and sintered together.

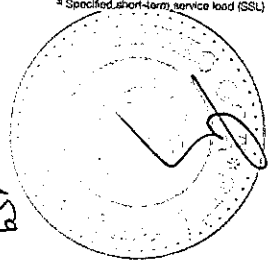
Strong focus on quality at all stages, from raw material through to finished product, ensures that ABB surge arresters survive the designed stresses with ease and with good margins. Different dimensions permit a large variety of standard arresters as well as client-specific solutions with regards protection levels, energy capability and mechanical performance.

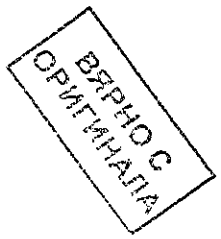
This Buyer's Guide deals with high voltage surge arresters for standard AC applications. For other applications, such as series capacitors protection, shunt capacitor protection or DC applications, contact your ABB sales representative.

Product range

Arrester classification	Type	Max. system voltage [1] kV_{rms}	Rated voltage [2] kV_{rms}	Energy requirement/ Lightning intensity	Mechanical strength [3] Nm
PEXLIM — Silicone polymer-housed arrester					
Superior where low weight, reduced clearances, flexible mounting, non-fragility and additional personnel safety is required.					
Major component for PEXLINK™ concept for transmission line protection.					
10 kA, IEC station class designation SL	PEXLIM R-Z	72 - 145	75 - 120	Moderate	1 300
10 kA, IEC station class designation SL	PEXLIM R-Y	24 - 170	18 - 144	Moderate	1 600
10 kA, IEC station class designation SM	PEXLIM Q	52 - 420	42 - 396	High	4 000
20 kA, IEC station class designation SH	PEXLIM P-X	52 - 420	42 - 360	Very high	4 000
20 kA, IEC station class designation SH	PEXLIM P-Y	300 - 550	228 - 444	Very high	9 000
TEXLIM — High strength silicone polymer-housed arrester					
Specially suited to extreme seismic zones.					
10 kA, IEC station class designation SM	TEXLIM Q-C	123 - 420	90 - 420	High	40 000
20 kA, IEC station class designation SH	TEXLIM P-C	245 - 550	180 - 444	Very high	40 000
20 kA, IEC station class designation SH	TEXLIM T-C	245 - 800	180 - 624	Very high	40 000
EXLIM — Porcelain-housed arrester					
10 kA, IEC station class designation SL	EXLIM R	52 - 170	42 - 168	Moderate	7 500
10 kA, IEC station class designation SM	EXLIM Q-E	52 - 245	42 - 228	High	7 500
10 kA, IEC station class designation SM	EXLIM Q-D	170 - 420	132 - 420	High	20 000
20 kA, IEC station class designation SH	EXLIM P	52 - 550	42 - 444	Very high	20 000
20 kA, IEC station class designation SH	EXLIM T	245 - 800	180 - 624	Very high	20 000

[1] Arrester classification according to IEC 60099 4.
[2] Arresters with lower or higher voltages may be available on request for special applications.
[3] Specified short-term service load (SSL)





Definitions

NOTE! The standards referred to hereunder are the latest editions of IEC 60099-4 and IEEE C62.11

Maximum system voltage (Us)
The maximum voltage between phases during normal service.

Nominal discharge current (IEC)
The peak value of the lightning current impulse which is used to classify the arrester.

Lightning classifying current (ANSI/IEEE)
The designated lightning current used to perform the classification tests.

Rated voltage (U_r)
An arrester fulfilling the IEC standard must withstand its rated voltage (U_r) for 10 s after being preheated to 60 °C and subjected to energy injection as defined in the standard. Thus, U_r shall equal at least the 10-second TOV capability of an arrester. Additionally, rated voltage is used as a reference parameter.

NOTE! TOV capability of ABB arresters exceeds the IEC requirements.

Duty-cycle voltage rating (IEEE)
The designated maximum permissible voltage between its terminals at which an arrester is designed to perform its duty cycle.

Continuous operating voltage
The maximum permissible r.m.s. power frequency voltage that may be applied continuously between the arrester terminals. This voltage is defined in different ways (verified by different test procedures) in IEC and IEEE.

- IEC (U_c)
  IEC gives the manufacturer the freedom to decide U_c. The value is verified in the operating duty test.
- IEEE (MCOV)
  IEEE lists the maximum continuous operating voltage (MCOV) for all arrester ratings used in a table. The value is used in all tests specified by IEEE.

Temporary overvoltages (TOV)
Temporary overvoltages, as differentiated from surge overvoltages, are oscillatory power frequency overvoltages of relatively long duration (from a few cycles to hours).
The most common form of TOV occurs on the healthy phases of a system during an earth-fault involving one or more phases. Other sources of TOV are load-rejection, energization of unloaded lines, ferroresonance, etc. The TOV capability of the arresters is indicated with prior energy stress in the relevant catalogues.

Residual voltage/Discharge voltage
The peak value of the voltage that appears between the terminals of an arrester during the passage of discharge current through it. Residual voltage depends on both the magnitude and the waveform of the discharge current. The voltage/current characteristics of the arresters are given in the relevant catalogues.

Arrester class
- Distribution class arrester (IEC designations: DL, DM, DH)
  An arrester intended for use on distribution systems, typically of Us ≤ 52 kV, to protect components primarily from the effects of lightning.
- Station class arrester (IEC designations: SL, SM, SH)
  An arrester intended for use in stations to protect the equipment from transient overvoltages, typically but not only intended for use on systems of Us ≥ 72,5 kV.

Energy capability
The energy that a surge arrester can absorb, in one or more impulses, without damage and without loss of thermal stability. The energy capability of a surge arrester is different depending on the type, duration and grouping of applied impulses as well as what occurs afterwards. Arrester standards have historically not explicitly defined the energy capability of an arrester, and the current editions have specifically focused on attempting to resolve this deficiency in the following forms (IEC 60099-4 definitions):

- Repetitive charge transfer rating, Q_{rs}
  The maximum specified charge transfer capability of an arrester, in the form of a single event or group of surges that may be transferred through an arrester without causing mechanical failure or unacceptable electrical degradation to the MO resistors. This applies to both station and distribution class arresters.
- Thermal charge transfer rating, Q_{th}
  The maximum specified charge that may be transferred through an arrester or arrester section within 3 minutes in a thermal recovery test without causing a thermal runaway. This applies only to distribution class arresters.

- Thermal energy rating, W_{th}
  The maximum specified energy, given in kJ/kV of U_r, that may be injected into an arrester or arrester section within 3 minutes in a thermal recovery test without causing a thermal runaway. This applies only to station class arresters.

Short-circuit capability
The ability of an arrester, in the event of an overload due to any reason, to conduct the resulting system short-circuit current without violent shattering which may damage nearby equipment or injure personnel. After such an operation, the arrester must be replaced. The system short-circuit current may be high or low depending on the system impedance and earthing conditions and hence short-circuit capability is verified at different current levels.

External insulation withstand strength
The maximum value of the applied voltage of a specified wave shape which does not cause the flashover of an arrester. Unlike other equipment, arresters are designed to discharge internally and the voltage across the housing can never exceed the protective levels. Thus, the external insulation of arrester housings is self-protected and need not fulfill a certain standardized insulation class provided its insulation withstand strength is higher than the protective levels by a designated safety factor and appropriately corrected for installation altitude.

NOTE! The insulation withstand of ABB surge arresters has been thoroughly considered in the design, and spacings between metal flanges as well as spacings between flanges and grading rings are sufficiently large to withstand overvoltages appearing during current discharges. All ABB arresters are suitable for installations up to at least 1000 m above sea level, often with a large margin.

Pollution performance
IEC 60815 defines five levels of pollution (from very light to very heavy), with the traditional correspondingly required creepage for porcelain housings as indicated in the table below.

Site pollution severity class	Pollution level	Specific creepage in mm/kV (U_s)	Unified specific creepage distance mm/kV (U_s/ √3)
a	Very light	12.7	22.0
b	Light (L)	16	27.8
c	Medium (M)	20	34.7
d	Heavy (H)	25	43.3
e	Very heavy (V)	31	53.7

Polymeric insulators of hydrophobicity transfer material (HTM), e.g. silicone, present advantages including a generally improved pollution withstand behaviour when compared to similar ceramic insulators of equal creepage distance. From a pollution withstand or flashover point of view, a reduced creepage distance may be used on PEXLIM and TEXLIM arresters with such HTM insulators.

The creepage distance is the length measured along the housing's external profile and serves as a measure of the arrester performance in polluted environments with respect to the risk of external flashover. Since the mean diameter for all the standard arresters is less than 300 mm, the specific creepage distance is the same as the nominal creepage distance.

SSL
Specified long-term load allowed to be continuously applied during service without causing any mechanical damage to the arrester.

SLL
Specified short-term load allowed to be applied during service for short periods and for relatively rare events without causing any mechanical damage to the arrester.

MBL
Mean breaking load is the average breaking load for porcelain-housed arresters.

Definitions
Line Surge Arresters (LSA)

Backflashover
Occurs when lightning strikes the tower structure or overhead shield wire. The lightning discharge current, flowing through the tower and tower footing impedance, produces potential differences across the line insulation. If the line insulation strength is exceeded, flashover occurs i.e. a backflashover. Backflashover is most prevalent when tower footing impedance is high.

Compact insulation lines
Transmission lines with reduced clearances between phases and between phase and earth and with lower insulation level withstand than for normal lines for the same system voltage.

Coupling factor
The ratio of included surge voltage on a parallel conductor to that on a struck conductor. This factor is determined from the geometric relationships between phase and ground (or protected phase conductors). A value often used for estimation purposes is 0.25.

Keraunic level
Number of annual thunderstorm days for a given region.

LSA
Line Surge Arresters are intended for installation in overhead lines in parallel to the line insulators in order to prevent flashovers, which may be either:

- non-gapped line arrester (NGLA)
  arrester without internal or external series gap

- externally gapped line arrester (EGLA)
  arrester with series gap used to protect an insulator assembly from lightning-caused fast-front overvoltages only

NOTE! PEXLINK is a NGLA

Shielding
Protection of phase conductors from direct lightning strokes; generally, by means of additional conductor(s) running on the top of the towers and grounded through the tower structures.

Shielding angle
The included angle, usually between 20 to 30 degrees, between shield wire and phase conductor.

Shielding failure
Occurs when lightning strikes a phase conductor of a line protected by overhead shield wires.

Tower footing impedance
The impedance seen by a lightning surge flowing from the tower base to true ground. The risk for backflashover increases with increasing footing impedance.

Travelling waves
Occur when lightning strikes a transmission line span and a high current surge is injected on to the struck conductor. The impulse voltage and current waves divide and propagate in both directions from the stroke terminal at a velocity of approximately 300 meters per microsecond with magnitudes determined by the stroke current and line surge impedance.

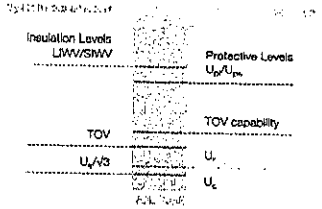
Simplified selection procedure

The selection is carried out in two major steps:

- Matching the electrical characteristics of the arresters to the system's electrical demands
- Matching the mechanical characteristics of the arresters to the system's mechanical and environmental requirements.

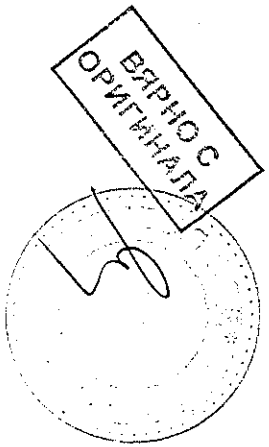
The final selection is reflected in the arrester type designation.

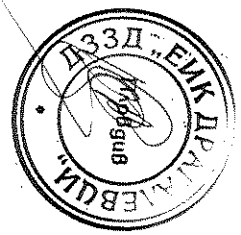
System/arrester parameters



Vocabulary

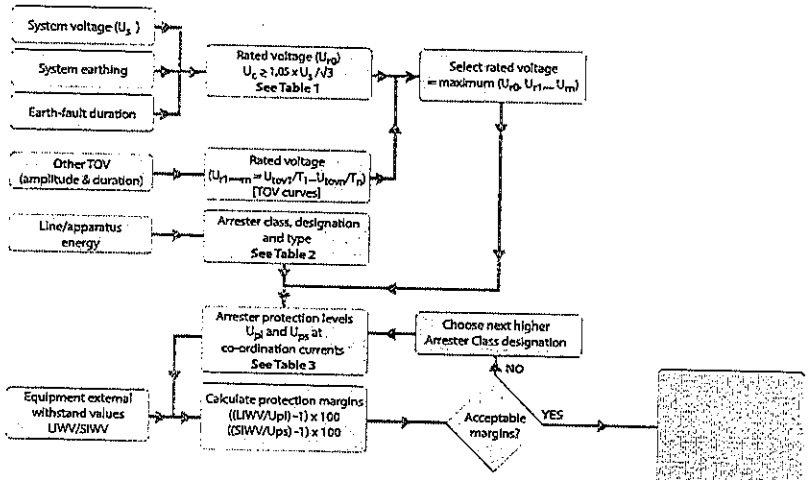
U_s	Maximum system voltage
U_c	Continuous operating voltage
U_r	Rated voltage
TOV	Temporary overvoltage
T	TOV strength factor
k	Earth fault factor
U_{ps}	Switching impulse protective level
U_{pl}	Lightning impulse protective level
U_{ws}	Switching impulse withstand level
U_{wl}	Lightning impulse withstand level
SIWV	Switching impulse withstand voltage
LIWV	Lightning impulse withstand voltage



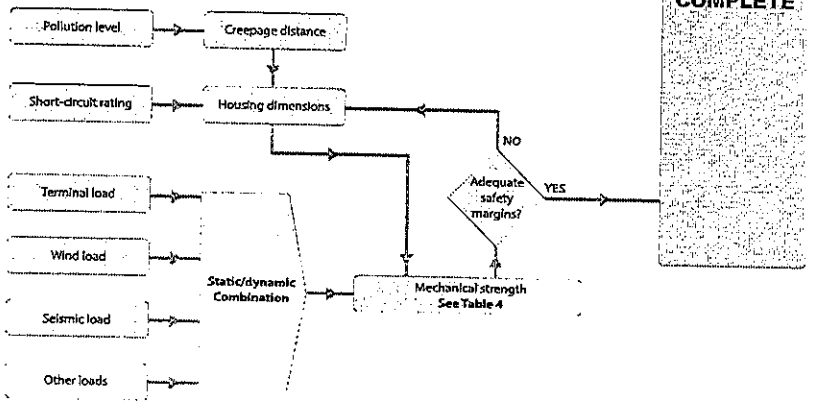


Flowchart for simplified selection of surge arresters

Electrical selection



Mechanical selection



Matching the system characteristics

Arrester rated voltage (U_r)

For each system voltage, the tables "Guaranteed protective data" show a range of U_r and maximum continuous operating voltages U_c, all of which are capable of withstanding the actual continuous operating voltage (U_{ca}) with sufficient margin. Hence, the selection of U_r is only a function of the applied temporary overvoltages, TOV, (U_{tov}), taking into account their amplitudes and duration.

TOV, as differentiated from surge overvoltages, are oscillatory power frequency overvoltages, with or without harmonics, of relatively long duration (from a few cycles to hours or longer) which are generated by system events. The arresters must withstand the heat energy generated by them.

Most commonly, a single or two-phase earth fault leads to a TOV in the healthy phase(s) and also in the neutral of Y-connected transformers. Its amplitude is determined by the system earthing conditions and its duration by the fault-clearance time.

If the earth-fault factor, ($k = U_{tov}/U_{cn}$, is 1.4 or less, the system is considered to be effectively earthed. Generally, this implies a solid connection of the neutral to the earth grid. All other forms of earthing via an impedance or a non-earthing of the neutral is considered as non-effective with, typically, $k = 1.73$

For effectively earthed systems, the fault-clearance time is generally under 1 s but it can vary widely among different systems. The catalogues list the values of TOV capability for 1 and 10 s duration after a prior energy stress (as a conservative approach). For other durations or for specific TOV conditions, follow the procedure hereunder:

- Consider each TOV separately.
- From the TOV curves, read off the TOV strength factor (T_r) for the time corresponding to the fault-clearance time.
- U_{tov}/T_r gives the minimum value of U_r for withstanding this TOV. Choose the next higher standard rating.
- The final choice of U_r will be the highest of the U_r values obtained from the above calculations for each TOV.

System earthing	Fault duration	System voltage U_s (kV)	Min. U_r (kV)
Effective	≤ 10 s	≤ 100	≥ 0.79 x U_s
Effective	≤ 1 s	≥ 123	≥ 0.74 x U_s
Non-effective	≤ 10 s	≤ 170	≥ 0.97 x U_s
Non-effective	≤ 1 h	≤ 170	≥ 1.24 x U_s

Table 1.

The table gives a suggested minimum value of the arrester rated voltage (U_r), based on common parameters. In each case, choose the next higher standard rating as given in the catalogue. This is only intended as a general guide, and actual U_r necessary may depend on the specific parameters of the system and the chosen arrester.

Note: Do not select a lower value of U_r than obtained as above unless the parameters are known more exactly; otherwise the arrester may be over-stressed by TOV.

Energy capability and Arrester Class designation

IEC classifies arresters by their application and nominal discharge current. Station class 10 and 20 kA arresters are further classified by energy capability expressed as a repetitive charge transfer rating and thermal energy rating. These arresters are thereafter designated as either SL, SM, or SH where the letters "L", "M" and "H" in the designation stand for "low", "medium" and "high" duty, respectively.

Matching the system characteristics

Arrester Class designation	Arrester type	Energy capability Wth kJ/kV (U_r)	Qrs(C)	Normal application range (U_s)
SL	EXLIM R	5	1.2	≤ 170 kV
	PEXLIM R-Z	5	1.2	≤ 145 kV
	PEXLIM R-Y	5	1.2	≤ 170 kV
SM	EXLIM Q-E	8	2.0	≤ 245 kV
	EXLIM Q-D	8	2.0	170-420 kV
	PEXLIM Q	8	2.0	≤ 420 kV
	TEXLIM Q-C	8	2.0	123-420 kV
SH	EXLIM P	11	3.2	≤ 550 kV
	PEXLIM P-X	11	3.2	≤ 420 kV
	PEXLIM P-Y	11	3.2	300-550 kV
	TEXLIM P-C	11	3.2	245-550 kV
	EXLIM T	15	5.2	245-800 kV
	TEXLIM T-C	15	5.2	245-800 kV

Table 2.

Energy capability of ABB arresters: The normal application range is only a guide, and depends on the specific parameters.

Though the energy capability is mentioned in a different manner in IEEE, the normal range of application as above applies even for IEEE systems. For specific and special cases, e.g. capacitor banks, it may be necessary to calculate the energy capability differently; for example as shown in the IEC 60099-5 and other guides.

Protection levels (U_{pl} and U_{ps})

For insulation coordination purposes, consider the lightning impulse protection level (U_{pl}) at 10 kA for $U_m \leq 362$ kV and at 20 kA for higher voltages. Similarly, the switching impulse protection levels (U_{ps}) for coordination purposes range from 0.5 kA (for $U_m \leq 170$ kV) to 2 kA (for $U_m \geq 362$ kV). The values can be read-off from the catalogue tables or easily computed from Table 3. In the latter case, they must be rounded upwards.

Arrester type	Nom. Discharge current (I_n)	U_{pl}/U_r at 10 kAp	U_{ps}/U_r at 20 kAp	U_{ps}/U_r
EXLIM R	10	2.590		2.060 at 0.5 kAp
PEXLIM R-Z	10	2.590		2.060 at 0.5 kAp
PEXLIM R-Y	10	2.590		2.060 at 0.5 kAp
EXLIM Q	10	2.350		1.981 at 1.0 kAp
PEXLIM Q	10	2.350		1.981 at 1.0 kAp
TEXLIM Q-C	10	2.350		1.981 at 1.0 kAp
EXLIM P	20	2.275	2.5	2.020 at 2.0 kAp
PEXLIM P-X	20	2.275	2.5	2.020 at 2.0 kAp
PEXLIM P-Y	20	2.275	2.5	2.020 at 2.0 kAp
TEXLIM P-C	20	2.275	2.5	2.020 at 2.0 kAp
EXLIM T	20	2.200	2.4	1.976 at 2.0 kAp
TEXLIM T-C	20	2.200	2.4	1.976 at 2.0 kAp

Table 3.

U_{pl} and U_{ps} ratios for ABB arresters

Matching the system characteristics

Protection margins

Protection margins (in %), calculated at coordinating impulse currents as per Table 3, are defined as follows:

- Margin for lightning impulses = ((LIWV/U_{pl})-1) x 100, where LIWV is the external insulation withstand of the equipment against lightning impulses.
- Margin for switching impulses = ((SIWV/U_{ps})-1) x 100 where SIWV is the external insulation withstand of the equipment for switching impulses.

Note: IEEE standards refer to LIWV as BIL and SIWV as BSL.

Margins are normally excellent due to the low U_{pl}, U_{ps} and also that most equipment at present have high external insulation withstand. However, depending on the electrical distance between the arrester and the protected equipment, the Upl margin is reduced and thus arresters fail to protect equipment that is not in the close vicinity of the arresters, i.e. within their protection zone. The flexible erection alternatives for PEXLIM arresters may be of benefit in reducing the distance effects. Additional line-entrance arresters may help too. For more detailed information, please refer to separate ABB technical publication regarding application guidelines for station protection.

Note! The "distance effect" reduction does not apply to U_{ps} margin since the front-time of a switching surge impulse is longer.

It is recommended that the protection margins (after taking into account the "distance effect") should be of the order of 20% or more to account for uncertainties and possible reduction in the withstand values of the protected equipment with age.

Should the selected arrester type not give the desired protection margins, the selection should be changed to an arrester of a higher designated energy class, which automatically leads to lower U_{pl}.

Note! Do NOT use a lower-than selected U_r to attempt improvement of the margins, as this may lead to unacceptably low TOV capability.

As an additional assistance in selection, please refer to the simplified flow chart at the beginning of this chapter. The MO resistor column must be suitably housed to withstand long-term effects of the system loading and the environmental stresses.

External creepage distance

IEC 60815 defines the minimum creepage distances for different environmental conditions. Select the housing to give the desired creepage — the same as for the other equipment in the same location. If the specific creepage demand exceeds 31 mm/kV, please refer to ABB for a special design.

PEXLIM and TEXLIM arresters, having a highly hydrophobic housing, are better suited for extremely polluted areas than EXLIM arresters and a lower creepage may be justified in many cases.

Matching the system characteristics

Mechanical strength

Surge arresters are an active protective device, which means they are not inherently intended to be permanently mechanically loaded in service. Naturally their design includes consideration to withstanding rarely-occurring and short-term mechanical loads (e.g. external short-circuit, gust winds, earthquake, etc) as well as more likely and long-term mechanical loads (e.g. conductor weight, static wind, etc). However, such loads should always be limited as much as possible though proper installation.

All ABB arrester designs exhibit very high strength under tensile or compression loading; hence it is the cantilever loading that is of interest in defining mechanical strength. To be applicable to different arrester lengths, the loading is given in terms of bending moment in this guide. The line terminal and the insulating base (when supplied) match or exceed the strength of the arrester housing.

Standard arresters are intended for vertical, upright erection on a structure and require no bracing. Pedestal-mounted arresters with mechanical strength higher than listed can be quoted on request. Special arresters for suspension, inverted mounting or other angular erection are also available.

Due to their otherwise advantageous flexible construction, PEXLIM arresters may exhibit a visible deflection at the line-end under maximum terminal loading. Such deflection is nevertheless limited by our specified value for long-term load (SLL) given in Table 4. This maximum recommended continuous loading ensures that the electrical and mechanical functions of the arrester are not impaired in any way, even during long-term cyclic loading. Importantly, the value for specified short-term load (SSL) can be upheld even after such cyclic loading.

If the permissible bending moment for a certain arrester appears insufficient for a given loading, consider one of the following methods to reduce the loading demand.

- Use lighter terminal clamps and/or optimized tee-offs for arresters. In contrast to the current capability (and thus the size of clamps and conductors) required for other substation equipment, the continuous current through an arrester is of the order of only a few mA. Hence, using a lighter terminal clamp and/or connecting the arresters by lighter and more vertical tee-offs can considerably reduce the demand for mechanical strength.
- Use another erection alternative (suspension, underhung, etc). Since PEXLIM arresters are very light compared to equivalent porcelain-housed arresters, they permit innovative erection alternatives, which could reduce the bending moment demands. This in turn can lead to the additional benefit of lighter structures with subsequent reduced costs, or even the complete elimination of the need for a separate structure at all.

EXLIM
Porcelain-housed insulator

Arrester type	Cantilever strength (Nm)	
	SSL	SLL
EXLIM R-C	7 500	3 000
EXLIM Q-D	20 000	8 000
EXLIM Q-E	7 500	3 000
EXLIM T-B	20 000	7 200

PEXLIM
Silicone polymer-housed insulator

Arrester type	Cantilever strength (Nm)	
	SSL	SLL
PEXLIM R-Z	1 300	800
PEXLIM R-Y	1 600	1 000
PEXLIM Q-Y	4 000	2 500
PEXLIM P-Y	9 000	6 000

TEXLIM
High strength silicone polymer-housed insulator

Arrester type	Cantilever strength (Nm)	
	SSL	SLL
TEXLIM Q-C	40 000 Nm	21 000
TEXLIM P-C	40 000 Nm	21 000
TEXLIM T-C	40 000 Nm	21 000

SSL Specified short-term load. | SLL Specified long-term load. (For PEXLIM and TEXLIM arresters this is a declared value based on cyclic loading.)

Table 4. Permissible mechanical loading for ABB arresters

Matching the system characteristics

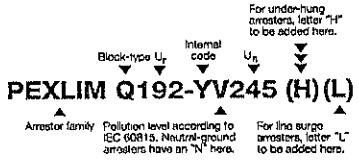
Neutral-ground arresters

For neutral-ground arresters the recommended rated voltage is approximately the maximum system voltage divided by √3. The recommended neutral-ground arresters in the relevant sections are calculated for unearthed systems with relatively long fault duration. The electrical characteristics are identical to standard catalogue arresters with the corresponding rated voltage. For such arresters, U_c is zero since they are not subject to any continuous voltage stress during normal service conditions. The neutral-ground arresters should preferably be of the same type as the phase-ground arresters. For resonant-earthed systems with long radial lines special considerations must be taken and a higher rated voltage (20% to 40%) than listed may be necessary.

Type designation

The type designation itself gives detailed information of the arrester and its application. See the figure below. As standard, the arresters are meant for upright vertical erection. For under-hung erection, when desired, the type designation has the suffix letter "H". For other angular erection, please inform us at order. For non-standard arresters the type designation will have additional suffix letters, for example:

E	Non-standard electrical data
M	Non-standard mechanical data
P	Non-standard metal-oxide columns



Special applications

Please consult your nearest ABB representative for help in selection of arresters for special applications such as protection of shunt or series capacitor banks, cables and cable-aerial junctions, rotating machines, traction systems, overhead lines, HVDC or for non-standard arrester ratings or extreme mechanical demands.

Ordering data for arresters

The following information, at a minimum, is required with your order:

- Quantity and type designation
- Rated voltage
- Type of line terminal
- Type of earth terminal
- Type of surge counter, if any
- Type of insulating base, if any.

(Insulating base is required if surge counter and/or leakage current measurements are desired. One base is required for each arrester.)

Ordering example

Below is a typical example of an order with three PEXLIM arresters and its accessories.

Number	Item
3	PEXLIM Q192-YH245, rated voltage 192 kV
3	Line terminal type 1HSA 410 000-L
3	Earth terminal type 1HSA 420 000-A
3	Insulating base type 1HSA 430 000-A
3	Surge counter type EXCOUNT-C

Note! We recommend that the order form, on page 137, be filled-in and attached to your order to ensure inclusion of all the important parameters and commercial conditions.

Simple selection example

Substation data	
Maximum system voltage	145 kV
Arrester location	Phase-ground
System earthing	Effective
System fault clearance time	1 s
Creepage distance	3625 mm

1. $U_{r0} = 0.74 \times U_s$ (according to table 1) = 0.74x145 = 107.3 kV_{rms}. Select the next higher standard U_r (see "Guaranteed protective data"), i.e. 108 kV_{rms}.

2. According to table 2, a common choice selection for 145 kV_{rms} would be a Arrester Class designation SL arrester, i.e. PEXLIM R. This arrester has a U_{pl}/U_r of 2.59, i.e. U_{pl} of 280 kV_{peak} at 10 kA (according to table 3). With a LIWV of 650 kV_{peak} this would give a protective margin of (650/280-1)x100 = 132%.

3. This margin appears to be excellent but it must be noted that, after considering distance effect and possible insulation ageing, the margin could be reduced to below 20% depending on the impinging impulse steepness and amplitude. Thus, it is very important that the arrester is installed as close as possible to the protected object.

4. If the margin is considered insufficient, choose a higher class designation arrester, e.g. PEXLIM Q, with the same rated voltage 108 kV.

5. With a required creepage distance of 3625 mm, i.e. 25 mm/kV SCD, a H145 housing is suitable from the range.

6. The type designation of the selected arrester will then be:

   PEXLIM R108-YH145 (or PEXLIM Q108-YH145)

Design features
Porcelain-housed arresters EXLIM

The design is based on successful experience of over 75 years, first as gapped SiC arresters, in all climates and conditions all over the world. EXLIM arresters live up to their name: EXcellent voltage LIMiters. The design is robust and well-matched with the other apparatus in substations.

Each arrester is built up of one or more units. Each unit is a porcelain housing containing a single column of MO resistors (blocks), all individually extensively routine-tested during manufacture, dispersed with the necessary spacers as determined by the electrical design for the arrester. It is necessary, therefore, that the units are series-connected at site in the pre-determined order as marked on the units. Consult the installation instructions supplied with each arrester.

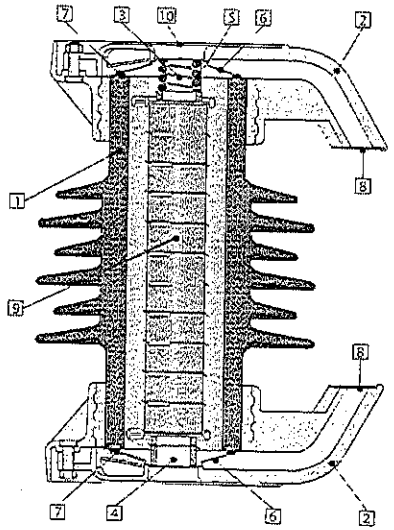
Longer arresters often require (and are supplied with) external grading rings to maintain a uniform and acceptable voltage stress along their length. Operation of such arresters without the grading rings, therefore, may lead to failure and invalidates our guarantees/warranties.

The standard porcelain color is brown but grey porcelain is supplied on request.

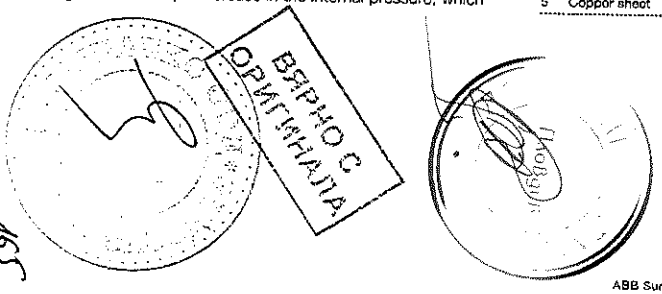
Seaworthy packing of the arresters is standard.

Sealing and pressure-relief function
The flanges are cemented to the porcelain and enclose also the sealing arrangement. Please see the figures herein. For satisfactory performance, it is important that the units are hermetically sealed for the lifetime of the arresters. The sealing arrangement at each end of each unit consists of a pre-stressed stainless steel plate with a rubber gasket. This plate exerts a continuous pressure on the gasket against the surface of the insulator and ensures effective sealing even if the gasket "sets" due to ageing. It also serves to fix the column of the blocks in the longitudinal direction by means of springs. The sealing is verified for each unit after manufacture in routine tests.

The sealing plate is designed to act also as an over-pressure relief system. Should the arrester be stressed in excess of its design capability, an internal arc is established. The ionized gases cause rapid increase in the internal pressure, which in turn causes the sealing plate to flap open and the ionized gases to flow out through the venting ducts. Since the ducts at the two ends are directed towards each other, this results in an external arc; thus relieving the internal pressure and preventing a violent shattering of the insulator.



1	Porcelain insulator	6	Sealing cover
2	Venting duct	7	Sealing ring
3	Spring	8	Indication plates
4	Desiccant bag	9	MO resistors
5	Copper sheet	10	Flange cover



Design features
Porcelain-housed arresters EXLIM

Mechanical Strength
The mechanical strength of the housing is defined in accordance with IEC 60099-4. Thus the guaranteed mean breaking load (MBL) is at least 20% above the specified figure for short-term service load (SSL). The insulating base (when supplied) matches the strength of the housing.

The specified long-term load (SLL) should be limited to 40% of the SSL in accordance with IEC 60099-4.

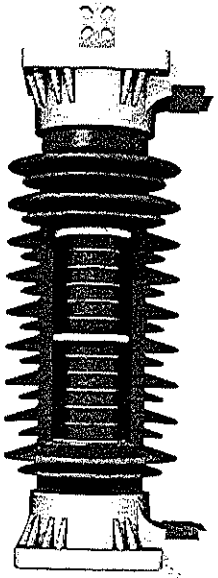
Arresters with mechanical strength higher than listed are quoted on request.

Mechanical loading — Horizontal (cantilever) load
The maximum permissible continuous horizontal load is calculated as the maximum continuous (static) moment divided by the distance between the base of the arrester and the centre of the terminal load.

The continuous current through an arrester is of the order of a few mA. Hence, using a lighter terminal clamp and/or connecting the arrester by a lighter tee-off considerably reduces the demand for mechanical strength.

Installation, maintenance and monitoring
Standard EXLIM arresters are intended for vertical, upright erection on a structure and require no bracing. Special EXLIM arresters for suspension, inverted mounting or other angular erection are available on request.

EXLIM arresters are easy to install following the instructions packed with each arrester. Installation does not need any special tools or instruments. Properly chosen and installed arresters are practically maintenance-free for their lifetime and do not need any monitoring. However, if such monitoring is demanded, it is easily performed online by using the EXCOUNT-II with it's built-in features for correctly measuring the resistive leakage current.

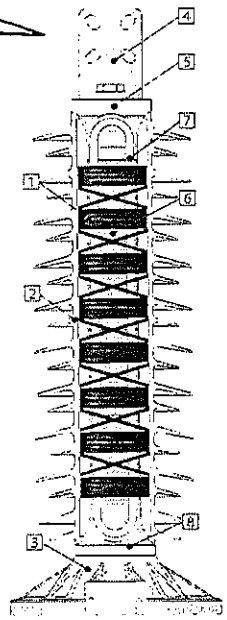


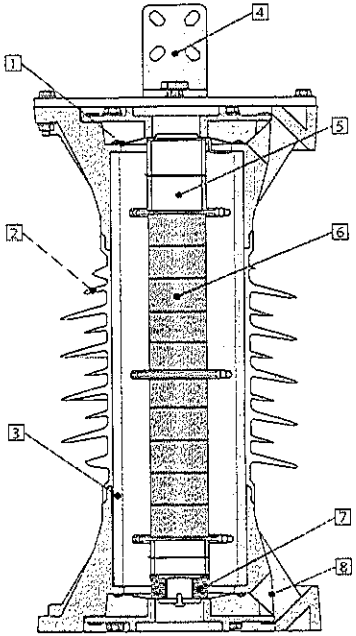
Design features
Polymer-housed arresters PEXLIM and TEXLIM

PEXLIM and TEXLIM arresters use the same MO resistors as the EXLIM arresters and match their electrical performance. Silicone as outer insulation material has been used for over 30 years with good results and has been chosen by ABB for arresters as well. It confers the additional benefits of low weight, improved pollution performance, increased personnel safety and flexibility in erection.

Two basic designs

The ABB polymer-housed arresters comes in two different designs:





Moulded PEXLIM design	
1 Protective winding	2 Silicone rubber insulator
3 Base	4 Line terminal
5 Top yoke	6 MO resistors
7 Fibre glass loop	8 Bottom yoke

TEXLIM tube design	
1 Sealing cover	2 Silicone rubber insulator
3 Fibre glass tube	4 Line terminal
5 Spacers	6 MO resistors
7 Spring	8 Venting duct

Design features
Moulded PEXLIM design

Design Highlights

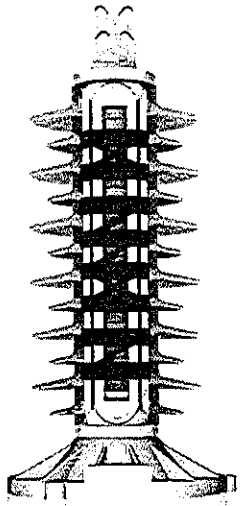
Each arrester is built-up of one or more units, which in turn may be made up of one or more modules. Each module contains a single column of MO resistors (blocks), which are extensively individually routine-tested during manufacture, dispersed with the necessary spacers as determined by the electrical design for the arrester. The modules are standardized into different sizes based on electrical, mechanical and process considerations.

ABB employs a unique patented design to enclose the blocks in each module under axial pre-compression in a cage formed of fibreglass reinforced loops fixed between two yokes which also serve as electrodes. A protective fibre-winding is then wound over the loops resulting in an open cage design for the module. This results in high mechanical strength and excellent short-circuit performance. See the figures hereunder.

Each module is then passed through a computer-controlled cleaning and priming process. The module is then loaded in a highly automated vulcanizing press and silicone injected at a high pressure and temperature (HTV process) to completely bond to the active parts, leaving no internal voids or air spaces. Individual modules are thereafter assembled into units and routine tested before packing and dispatch.

For satisfactory performance, it is important that the units are hermetically sealed for the lifetime of the arresters. The HTV moulding process under vacuum ensures this by bonding along the entire length from electrode to electrode. There is no air or any gas entrapped between the active parts and the housing. Hence, gaskets or sealing rings are not required.

Should the arrester be electrically stressed in excess of its design capability, an internal arc will be established. Due to the open cage design, it will easily burn through the soft silicone material, permitting the resultant gases to escape quickly and directly. At the same time, the fibre-windings prevent the explosive expulsion of the internal components. Hence, special pressure-relief vents are not required for this design; with the fail-safe short-circuit capability well verified by short-circuit tests in accordance with IEC/IEEE.



Cutaway view of a typical PEXLIM module showing the internal arrangements and the open-cage construction designed to improve both mechanical strength and personnel safety.

Design features

High strength TEXLIM tube design

In special cases with very high demands for mechanical strength, the moulded design may not provide the optimal solution — particularly at system voltages above 420 kV. Instead, what is required is a mix between the features of the standard EXLIM and the moulded PEXLIM designs. The TEXLIM tube design provides this by offering comparable mechanical strength to EXLIM arresters, but with much less mass. The seismic and pollution performance is in line with the moulded PEXLIM arresters and thus superior to conventional porcelain designs.

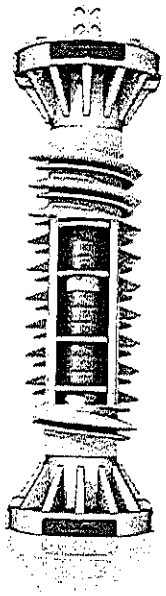
Design highlights

The basic concept is the replacement of the porcelain housing used with EXLIM arresters by a fibreglass tube housing onto which the silicone sheds are vulcanized and metal flanges are integrated. The internal arrangement and the pressure-relief devices are similar to those for EXLIM arresters.

For satisfactory performance, it is important that the units are hermetically sealed for the lifetime of the arresters. The sealing arrangement at each end of each unit is shown in the figure hereunder and consists of a pre-stressed stainless steel plate with a rubber gasket. This plate exerts a continuous pressure on the gasket against the inner surface of the flanges and ensures effective sealing even if the gasket "sets" due to ageing. It also serves to fix the column of the blocks in the longitudinal direction by means of heavy spring washers.

To maintain the interior free of any humidity, the unit is evacuated after the sealing plate and gaskets are fitted and then filled with dry air at low dew point. Additionally, a small bag of a desiccant is placed in each unit during assembly. Sealing is verified for each unit after manufacture during routine tests.

The sealing plate is designed to also act as an over-pressure relief system. Should the arrester be electrically stressed in excess of its design capability, an internal arc is established. The ionized gases cause a rapid increase in the internal pressure, which in turn causes the sealing plate to flap open and the ionized gases to flow out through openings in the flanges. Since the openings at the two ends are directed towards each other this results in an external arc; thus relieving the internal pressure and preventing a violent breaking of the insulator.



Cutaway view of a typical TEXLIM unit showing the internal arrangements.

Silicone as an insulator

All PEXLIM and TEXLIM arresters utilize silicone for the external insulation. Silicone rubber is highly hydrophobic and resistant to UV radiation and has been shown to be the best insulation (compared to both porcelain and other polymers) based on world wide independent laboratory and field tests. ABB uses special fillers to enhance these properties as well as giving it high pollution resistance, tracking resistance and fire-extinguishing features. The silicone housing is available only in grey color. For additional information, please refer to publication 1HSM 9543 01-06en.

In a form-fit-function comparison, PEXLIM is the most optimized and cost-effective of the available polymer designs. A separately defining criteria often becomes the mechanical strength demands. TEXLIM would seemly have the advantage in this regard, and it could be that specific applications do require a very strong composite tube solution. However, mechanical loads should always be limited as much as possible though proper installation using good engineering practices, and by so doing, the PEXLIM design remains the first choice for the vast majority of applications.

Installation, maintenance and monitoring

All ABB arresters are easy to install following the instructions packed with each arrester. Installation does not need any special tools or instruments.

The units of multiple-unit arresters must be series-connected at site in a pre-determined order as marked on the units and explained in the instructions that are packed in each case. An incorrect assembly may lead to failure and invalidates our warranty.

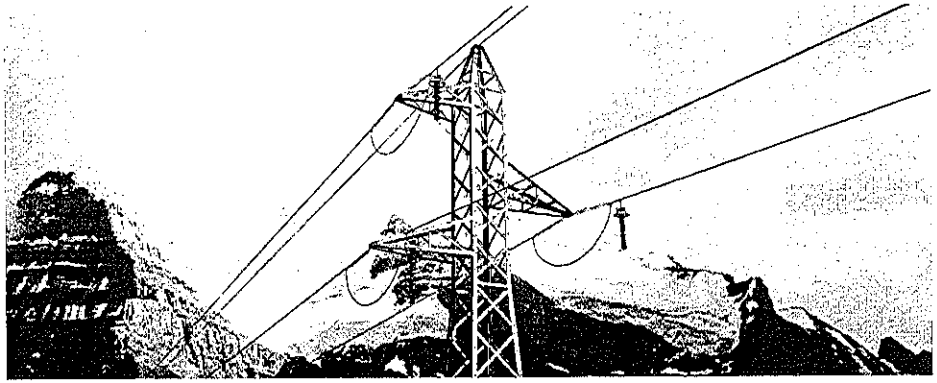
The design of tall arresters often requires external grading rings to maintain a uniform and acceptable voltage stress along their length. Such rings are included in the delivery of arresters. Installation or operation of such arresters without these grading rings may lead to failure and invalidates our warranty.

Properly chosen and installed arresters are practically maintenance-free for their lifetime and do not need any monitoring. However, if such monitoring is desired, it is easily performed online by using EXCOUNT-II with its built-in features for diagnostic analysis of resistive leakage current. More information is available in the chapter dealing with accessories.

Line surge arresters PEXLINK

The concept

Both large and small public/private utility owners of transmission systems face a sharpened competitive situation which demands increased availability and reliability of the systems. Consumers have become more demanding as their processes are dependent on constant and reliable energy supply of good quality.



In many countries, it has also been increasingly difficult to obtain permission to build new lines of normal dimensions. Hence, new lines under construction may mostly be "compact-insulation" lines. This, in turn, requires optimal control of overvoltages caused by lightning or switching events. Surge arresters installed along the line or at a few selected critical towers, in this case, may be an attractive solution or a complement to other means.

Improvement in the reliability and availability of a transmission system can be obtained in one or more of the following ways:

1. Duplication of the system (more than one line)
This is a very expensive method and often impractical.

2. Increased insulation withstand.
It can both be expensive and create other problems such as the need for increased insulation of station equipmont.

3. Improved footing impedance
Often difficult and expensive, especially in hilly terrain.

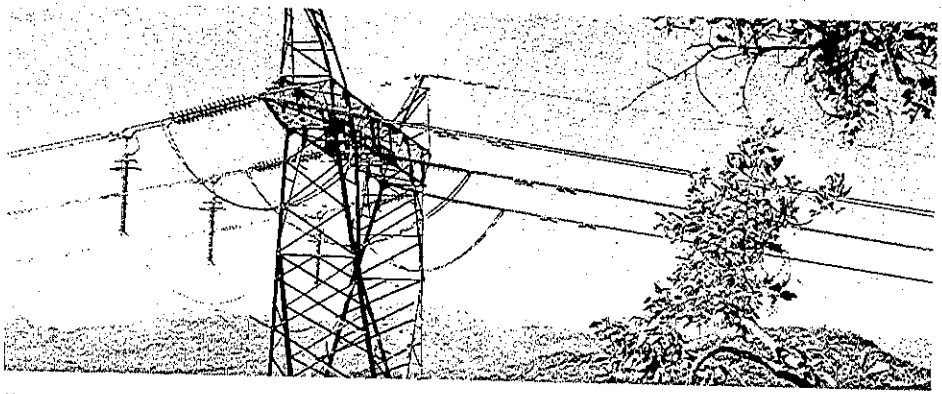
4. Shield wires
If the provision was not in the original tower design, it can be expensive to retrofit such shielding. It helps eliminate a large number of interruptions, but it may not be enough to obtain the now-demanded degree of reliability.

5. Protection of line insulation by surge arresters
Surge arresters connected in parallel with them at selected towers. In this application usually the term line surge arresters (LSA) is used. Protection using polymer-housed arresters (ABB type PEXLIM) along with additional accessories for fixing the arresters across the insulators and providing automatic disconnection of the arresters in the event of their being overstressed is called the PEXLINK concept. This method is simple, cost-effective and, in many cases, an attractive alternative to the methods mentioned above.

More information on Internet
Visit www.abb.com/arrestersonline for viewing the PEXLINK video.

PEXLINK
ABB's protection philosophy

ABB's philosophy is to provide protection for line insulation at selected locations by using standard available components. The main item is the gapless silicone polymer-housed arrester, PEXLIM, with metal-oxide (MO) active elements. Such arresters have been used for many years for protection of equipment in substations and hence their protective performance and reliability is well-known.



Line surge arresters, incorporating PEXLIM Q arresters and disconnecting devices on earth leads, erected on ESKOM 300 kV system in South Africa.

The low weight permits installation on existing structures and the polymer housing gives increased safety of the line equipment as well as people and animals which may be in the vicinity of the lines during overstress conditions.

With regard to lightning energy, line arresters are exposed to more severe conditions than arresters placed in substations. The latter are benefited by the reduction of surge steepness due to line corona effect and reduction in surge amplitude as the lightning current finds parallel paths through shielding wires, flashover and parallel lines. Thus, it is necessary to ensure that the MO resistors of the LSA are not under-dimensioned from an energy and current point-of-view. A computer program is used to determine the optimum number of locations (generally where the footing impedance is high) and to calculate the arrester stresses at each of the chosen locations.

The design permits installation using standard transmission-line hardware normally available locally. The design also permits mounting at different positions based on tower geometry and conductor spacing.

If very high availability is desired, a very large number of locations may have to be protected, mainly due to the unpredictable nature of lightning. In such a case it may not be economically justified to select arresters with "sufficient energy capability" and instead a higher failure rate may be acceptable.

To ensure quick, safe, automatic and controlled disconnection of a failed arrester, ABB uses a special disconnecting device with a suitable link, often in the earthing circuit of the arresters.

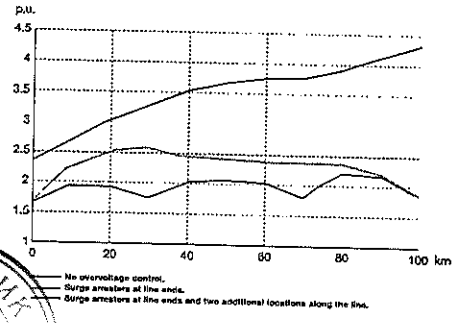
The recommended earth lead is designed to withstand the short-circuit currents and the disconnecting device is tested to ensure no false operations. Thus, at a failure, the tripped line does not have to be locked-out and attended to immediately.

PEXLINK
Application

Increased line availability
By locating the PEXLINK on sections of lines with high footing impedance towers and one additional low footing-impedance tower at each end of the section, PEXLINK protects existing shielded and non-shielded lines from abnormal lightning surges (frequent or high amplitudes) and reduces the outages.

The reduced outages are beneficial also indirectly in that sensitive equipment is not damaged and the circuit breakers overhaul interval can be increased. Thus, total maintenance costs are also reduced.

This protection may be used for all system voltages where the stated abnormal conditions exist. Arresters with moderate energy capability are often sufficient. However, the high-current capability must be large and distribution-type arresters may not be suitable.



The diagram shows overvoltages phase-ground generated by three-phase reclosing of 550 kV, 200 km transmission line with a previous ground fault. For long EHV lines pre-insertion resistors traditionally are used to limit switching overvoltages. Surge arresters, as a robust and efficient alternative, could be located at line ends and along the line at selected points.

Switching overvoltage control
For long EHV lines, surge arresters usually are located at line-ends. In addition, by locating arresters at one or more points along the line e.g. at midpoint or 1/3 and 2/3 line length switching surge overvoltages and thus line insulation requirements could be limited without using preinsertion resistors. Arresters used for this type of application should be designed for high energy capability, especially at the receiving end of the line.

Compact-insulation lines
Arresters placed in parallel with line insulators permit a large degree of compacting of a transmission line with lower right-of-way costs as a result.

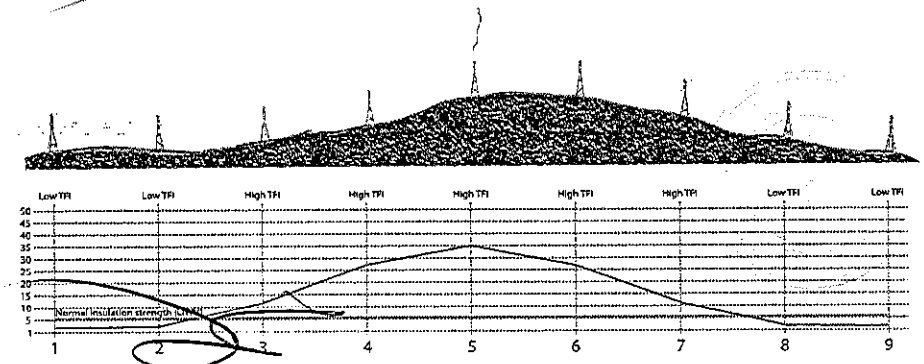
Line upgrading
The existing insulation level of a line, when suitably protected by arresters, may be upgraded for service at a higher system voltage leading to greater power transfer without much additional capital cost.

Extended station protection
By locating arresters on towers near a substation, the risk of backflashovers near the station is eliminated. This results in reduction of steepness and amplitude of incoming travelling waves, thus improving the protection performance of station arresters and eliminating the need for additional expensive metal-enclosed arresters even for large GIS.

Substitute for shield wires
In cases where provision of shield wires is not practical physically or is very expensive, e.g. very long spans, very high towers etc, arresters are a good and economical substitute.

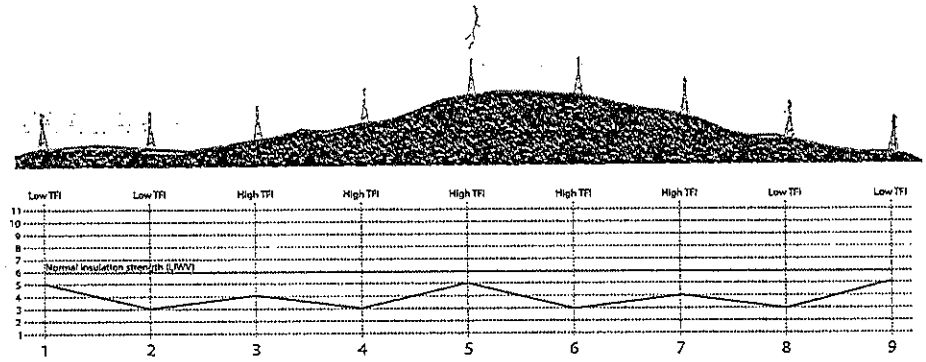
Arresters located in all phases on each tower eliminate the need for both shield wires and good footing impedance and may be economically justified in cases where the cost of reduction in footing impedance and the cost of overhead shield wire are very high.

PEXLINK
Application



No arresters at all. Lightning stroke to tower number 5

Very high risk for flashover due to high TFI (Tower Footing Impedance) with an earth fault followed by a circuit breaker operation as a consequence.



Arresters in all 9 towers. Lightning stroke to tower number 5

The overvoltage profile is well below the LIWV of the system all along the section. An ideal protection is obtained.

PEXLINK
Features

Lightning discharge capability

In general, arresters on lines are subjected to higher energy and current stresses caused by lightning than arresters installed in stations. Furthermore, the associated waveform and durations differ considerably from those specified for station arrester applications. Thus, line arresters are defined in terms of their lightning discharge capability, and PEXLIM arresters perform well in this regard.

Arrester type	Lightning discharge capability as per IEC 60099-4 Annex H	
	Energy	Charge
PEXLIM R	2.5 kJ/kV (U_r)*	1.0 As **
PEXLIM Q	4.0 kJ/kV (U_r)*	1.8 As **
PEXLIM P	7.0 kJ/kV (U_r)*	2.8 As **

* U_r = Rated voltage
** As = Ampere second

Standard components

The suspension of the arresters is simplified and standard clamps and similar hardware normally available may be used for this purpose. This leads to overall economy for the user.

A few examples can be seen in the figures for "Some erection alternatives" on next page.

The disconnecting device is carefully chosen to perform its function only at the overload of the arrester.

The separation of the disconnector is quick and effective and the method of connection advised by ABB in each particular case ensures that neither the disconnected conductor nor the damaged arrester cause any interference with other live parts. Thus, after a failure, the line can be re-charged without attending to it immediately.

The disconnection is easily visible from the ground and thus locating it is simple for the maintenance crew.

Easy to install

The PEXLIM arresters are built-up of optimum-length modules and hence can be easily designed for use on various voltages. They are light and easily transported up the towers.

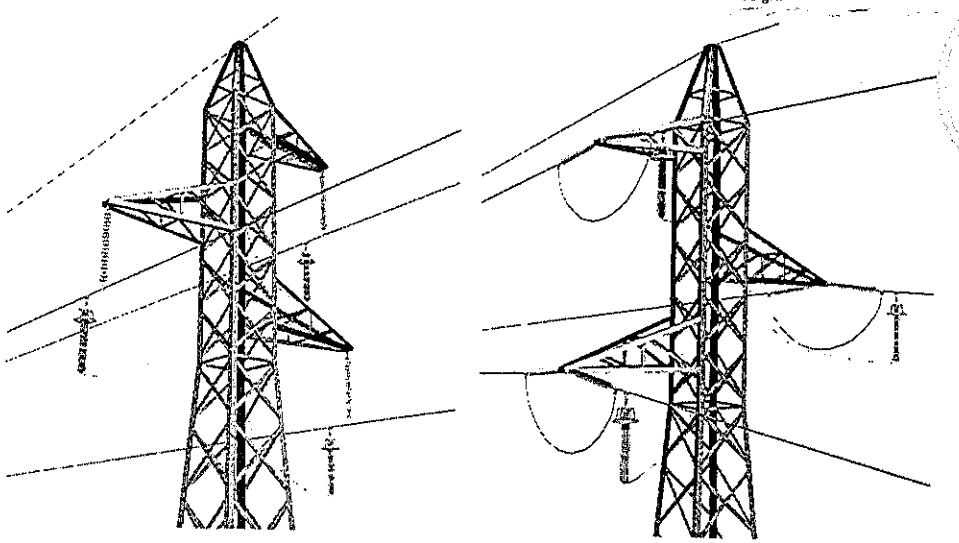
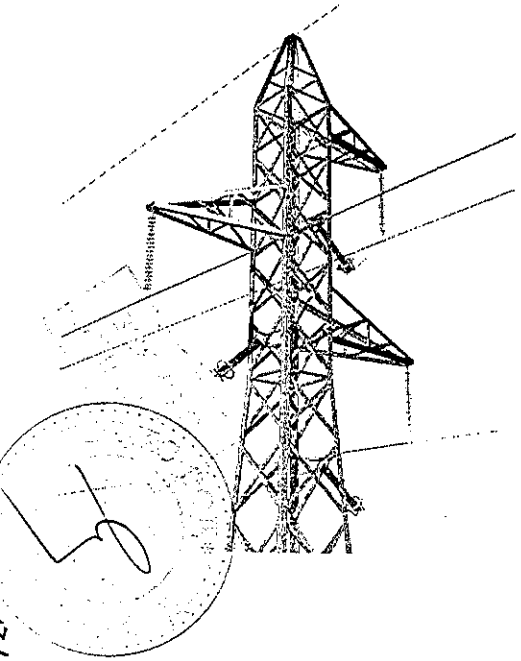
Some erection alternatives

Different arrangements showing how easy it is to install the PEXLINK concept in towers of different design.





Quality control and testing

ABB is certified to fulfil the requirements of ISO 9001

Type tests
Type (design) tests have been performed in accordance with IEC 60099-4. Test reports are available on request.

Routine tests
Routine tests are performed on MO resistors as well as on assembled arrester units and accessories. The most important type tests data is verified on all batches of MO resistors, thus verifying catalogue data.

Tests on MO resistors

Energy withstand test on all blocks
Each individual MO resistor passes three energy test cycles with cooling in-between. In each cycle, the injected energy is in excess of the rated energy capability. Blocks with insufficient energy capability are automatically rejected.

Classification and inspection
Each individual MO resistor is classified at 1 mA (d.c.) and 10 kA (8/20 µs) and the voltages are printed on each block together with a batch identification. Finally all blocks are visually inspected.

Accelerated life test on samples
Power losses after 1000 hours calculated from a test with shorter duration (approximately 300 hours) at an elevated temperature of 115 °C at 1.05 times U_c shall not exceed the losses at start of the test. Batches in which unapproved blocks appear are rejected.

Energy capability test on samples
Validation of repetitive charge transfer rating (Qrs), based on the same sampling and test procedure and criteria as the IEC 60099-4 type test for station class. The samples are representative of the highest residual voltage of MO resistors from the individual batch in order to verify the statistical quality of each produced batch of all sizes of MO resistors. Batches which do not fulfill the criteria are rejected.

Impulse current test on samples
Selected blocks are subjected to two 100kA current impulses (4/10 µs) at spaced intervals.

Other sample tests
In addition to the above, low current characteristics, protection characteristics, power losses and capacitance are checked to verify the inherent MO resistor parameters.

Tests on assembled mechanical units

Routine tests on units fulfil the demands of both IEC 60099-4 and ANSI/IEEE C62.11. Each arrester has a unique serial number.

Guaranteed residual voltage
The residual voltage at 10 kA, 8/20 µs impulse current of each unit is calculated as the sum of the residual voltages for all blocks connected in series in the unit.

The residual voltage of the complete arrester is the sum of the residual voltages for its units.

Tightness check (only for EXLIM and TEXLIM arresters)
During manufacture, a vacuum is drawn on the internal volume and then dry air is pumped in, together with a small amount of helium tracer gas, before sealing off the unit. A leakage test is performed by placing each unit in a vacuum chamber connected to a He-spectrometer. Maximum permissible leakage rate of Helium is 0.0001 mbarl/s at a pressure difference of 0.1 MPa as a pass/ no pass test.

Power frequency reference voltage
Reference voltage is measured on each arrester unit.

Internal corona
The satisfactory absence of partial discharge is checked on each unit at 0.9 times U_r. A steady internal corona level of not greater than 10 pC is required in a pass/no-pass test.

Grading current
The total leakage current passing through the arrester unit is measured at U_c for information only.

Power losses
Power loss is measured at U_c on each unit verifying that the thermal performance is in compliance with performed type tests.

Test reports
Routine test reports are filed and are available on request.

Tests on accessories

Surge counters and monitors
All such devices are routinely function-tested before leaving the factory.

Zinc Oxide Surge Arrester PEXLIM R-Z

Protection of switchgear, transformers and other equipment in high voltage systems against atmospheric and switching overvoltages. For use when requirements of lightning intensity, energy capability and pollution are moderate.

Superior where low weight, reduced clearances, flexible mounting, non-fragility and additional personnel safety is required.
Major component in PEXLINK™ concept for transmission line protection.

Other data can be ordered on request. Please contact your local sales representative.

Brief performance data

Arrester classification as per IEC 60099-4 Ed 3.0	Station: SL
Arrester classification as per IEEE Std C62.11-2012	Station
System voltages (U_s)	72 - 145 kV
Rated voltages (U_r)	75 - 120 kV
Nominal discharge current (IEC)	10 kA_{peak}
Lightning impulse classifying current (ANSI/IEEE)	10 kA_{peak}
Charge, energy and current withstand:	
Repetitive charge transfer rating, Q_{rs} (IEC)	1.2 C
Thermal energy rating, W_{th} (IEC)	5 kJ/kV (U_r)
Single impulse energy capability (2 ms to 4 ms impulse)	2.5 kJ/kV (U_r)
Discharge current withstand strength:	
High current 4/10 µs	100 kA_{peak}
Low current 2000 µs, (based on Q_{rs})	600 A_{peak}
Energy class as per IEEE standard (switching surge energy rating)	-
Single-impulse withstand rating as per IEEE standard	1.2 C
Repetitive charge transfer test value - sample tests on all manufactured block batches	1.5 C
Short-circuit/Pressure relief capability	40 $kA_{rms(sym)}$
Mechanical strength:	
Specified long-term load (SLL)	800 Nm
Specified short-term load (SSL)	1300 Nm
Service conditions:	
Ambient temperature	-50 °C to +45 °C
Design altitude	max. 1000 m
Frequency	15 - 62 Hz
Line discharge class (as per IEC60099-4, Ed. 2.2)	Class 2

Further data according to the IEEE standard can be supplied on request

1) The continuous operating voltages U_c (as per IEC) and MCOV (as per IEEE) differ only due to deviations in type test procedures.
Uc has to be considered only when the actual system voltage is higher than the tabulated.
Any arrester with U_c higher than or equal to the actual system voltage divided by √3 can be selected.

2) With prior duty equal to the thermal energy rating of 5 kJ/kV (U_r)

Arresters with lower or higher rated voltages may be available on request for special applications.

Each crate contains a certain number of arrester units and accessories for assembly and erection. A packing list is attached externally on each crate.

Each separate crate is numbered and the numbers of all crates and their contents are listed in the shipping specification. ABB reserves the right to pack arresters in the most effective/economic combination. Alternate or non-standard crates may involve additional charges.

The table above is to be seen as an approximation and specific data for deliveries may differ from the values given.

Zinc Oxide Surge Arrester PEXLIM Q-Y

Protection of switchgear, transformers and other equipment in high voltage systems against atmospheric and switching overvoltages.
- in areas with high lightning intensity and high energy requirements.
- where grounding or shielding conditions are poor or incomplete.

Superior where low weight, reduced clearances, flexible mounting, non-fragility and additional personnel safety is required.
Major component in PEXLINK™ concept for transmission line protection.

Other data can be ordered on request. Please contact your local sales representative.

Brief performance data

Arrester classification as per IEC 60099-4 Ed 3.0	Station: SM
Arrester classification as per IEEE Std C62.11-2012	Station
System voltages (U_s)	52 - 420 kV
Rated voltages (U_r)	42 - 396 kV
Nominal discharge current (IEC)	10 kA_{peak}
Lightning impulse classifying current (ANSI/IEEE)	10 kA_{peak}
Charge, energy and current withstand:	
Repetitive charge transfer rating, Q_{rs} (IEC)	2.0 C
Thermal energy rating, W_{th} (IEC)	8 kJ/kV (U_r)
Single impulse energy capability (2 ms to 4 ms impulse)	4.5 kJ/kV (U_r)
Discharge current withstand strength:	
High current 4/10 µs	100 kA_{peak}
Low current 2000 µs, (based on Q_{rs})	1000 A_{peak}
Energy class as per IEEE standard (switching surge energy rating)	E
Single-impulse withstand rating as per IEEE standard	2.2 C
Repetitive charge transfer test value - sample tests on all manufactured block batches	2.7 C
Short-circuit/Pressure relief capability	65 $kA_{rms(sym)}$
Mechanical strength:	
Specified long-term load (SLL)	2500 Nm
Specified short-term load (SSL)	4000 Nm
Service conditions:	
Ambient temperature	-50 °C to +45 °C
Design altitude	max. 1000 m
Frequency	15 - 62 Hz
Line discharge class (as per IEC60099-4, Ed. 2.2)	Class 3

Further data according to the IEEE standard can be supplied on request

[1] The continuous operating voltages (arrester class) as per IEC and MCOV (as per IEEE) differ only due to deviations in type test procedures.
U_r has to be considered only when the actual system voltage is higher than the tabulated
Any arrester with U_r higher than or equal to the actual system voltage divided by √3 can be selected.

[2] With prior duty equal to the thermal energy rating of 6 kJ/kV (U_r)

Arresters with lower or higher rated voltages may be available on request for special applications

Each crate contains a certain number of arrester units and accessories for assembly and erection. A packing list is attached externally on each crate.
Each separate crate is numbered and the numbers of all crates and their contents are listed in the shipping specification. ABB reserves the right to pack arresters in the most effective/economic combination. Alternate or non-standard crates may involve additional charges.

The table above is to be seen as an approximation and specific data for deliveries may differ from the values given.

Zinc Oxide Surge Arrester PEXLIM P-X

Protection of switchgear, transformers and other equipment in high voltage systems against atmospheric and switching overvoltages.
- in areas with very high lightning intensity
- where grounding or shielding conditions are poor or incomplete
- for important installations
- where energy requirements are very high (e.g. very long lines, capacitor protection).

Superior where low weight, reduced clearances, flexible mounting, non-fragility and additional personnel safety is required.

Major component in PEXLINK™ concept for transmission line protection.

Other data can be ordered on request. Please contact your local sales representative.

Brief performance data

Arrester classification as per IEC 60099-4 Ed 3.0	Station; SH
Arrester classification as per IEEE Std C62.11-2012	Station
System voltages (U_s)	52 - 420 kV
Rated voltages (U_r)	42 - 360 kV
Nominal discharge current (IEC)	20 kA$_{peak}$
Lightning impulse classifying current (ANSI/IEEE)	10/15 kA$_{peak}$
Charge, energy and current withstand:	
Repetitive charge transfer rating, Q_{rs} (IEC)	3.2 C
Thermal energy rating, W_{th} (IEC)	11 kJ/kV (U_r)
Single impulse energy capability (2 ms to 4 ms impulse)	7.0 kJ/kV (U_r)
Discharge current withstand strength:	
High current 4/10 µs	100 kA$_{peak}$
Low current 2000 µs, (based on Q_{rs})	1 600 A$_{peak}$
Energy class as per IEEE standard (switching surge energy rating)	G
Single-impulse withstand rating as per IEEE standard	3.2 C
Repetitive charge transfer test value - sample tests on all manufactured block batches	4.0 C
Short-circuit/Pressure relief capability	65 kA$_{rms(sym)}$
Mechanical strength:	
Specified long-term load (SLL)	2500 Nm
Specified short-term load (SSL)	4000 Nm
Service conditions:	
Ambient temperature	-50 °C to +45 °C
Design altitude	max. 1 000 m
Frequency	15 - 62 Hz
Line discharge class (as per IEC60099-4, Ed. 2.2)	Class 4

Further data according to the IEEE standard can be supplied on request

1) The continuous operating voltages U_c (as per IEC) and MCOV (as per IEEE) differ only due to deviations in type test procedures.
U_c has to be considered only when the actual system voltage is higher than the tabulated
Any arrester with U_c higher than or equal to the actual system voltage divided by √3 can be selected.

2) With prior duty equal to the thermal energy rating of 11 kJ/kV (U_r)

3) Arresters for system voltages 36 kV or below can be supplied on request, when the order also includes arresters for higher system voltages.

Arresters with lower or higher rated voltages may be available on request for special applications

1) The continuous operating voltages U_c (as per IEC) and MCOV (as per IEEE) differ only due to deviations in type test procedures.
U_c has to be considered only when the actual system voltage is higher than the tabulated
Any arrester with U_c higher than or equal to the actual system voltage divided by √3 can be selected.

2) With prior duty equal to the thermal energy rating of 11 kJ/kV (U_r)

Arresters with lower or higher rated voltages may be available on request for special applications

Each crate contains a certain number of arrester units and accessories for assembly and erection. A packing list is attached externally on each crate.

Each separate crate is numbered and the numbers of all crates and their contents are listed in the shipping specification. ABB reserves the right to pack arresters in the most effective/economic combination. Alternate or non-standard crates may involve additional charges.

The table above is to be seen as an approximation and specific data for deliveries may differ from the values given.

Zinc Oxide Surge Arrester PEXLIM P-Y

Protection of switchgear, transformers and other equipment in high voltage systems against atmospheric and switching overvoltages.
- in areas with very high lightning intensity
- where grounding or shielding conditions are poor or incomplete
- for important installations
- where energy requirements are very high (e.g. very long lines, capacitor protection).

Superior where low weight, reduced clearances, flexible mounting, non-fragility and additional personnel safety is required.

Other data can be ordered on request. Please contact your local sales representative.

Brief performance data

Arrester classification as per IEC 60099-4 Ed 3.0	Station; SH
Arrester classification as per IEEE Std C62.11-2012	Station
System voltages (U_s)	300 - 550 kV
Rated voltages (U_r)	228 - 444 kV
Nominal discharge current (IEC)	20 kA_{peak}
Lightning impulse classifying current (ANSI/IEEE)	10/15 kA_{peak}
Charge, energy and current withstand:	
Repetitive charge transfer rating, Q_{rs} (IEC)	3.2 C
Thermal energy rating, W_{th} (IEC)	11 kJ/kV (U_r)
Single impulse energy capability (2 ms to 4 ms impulse)	7.0 kJ/kV (U_r)
Discharge current withstand strength:	
High current 4/10 µs	100 kA_{peak}
Low current 2000 µs, (based on Q_{rs})	1 600 A_{peak}
Energy class as per IEEE standard (switching surge energy rating)	G
Single-impulse withstand rating as per IEEE standard	3.2 C
Repetitive charge transfer test value - sample tests on all manufactured block batches	4.0 C
Short-circuit/Pressure relief capability	65 $kA_{rms(sym)}$
Mechanical strength:	
Specified long-term load (SLL)	6000 Nm
Specified short-term load (SSL)	9000 Nm
Service conditions:	
Ambient temperature	-50 °C to +45 °C
Design altitude	max. 1 000 m
Frequency	15 - 62 Hz
Line discharge class (as per IEC 60099-4 Ed. 2.2)	Class 4

Further data according to the IEEE standard can be supplied on request

Each crate contains a certain number of arrester units and accessories for assembly and erection. A packing list is attached externally on each crate.

Each separate crate is numbered and the numbers of all crates and their contents are listed in the shipping specification. ABB reserves the right to pack arresters in the most effective/economic combination. Alternate or non-standard crates may involve additional charges.

The table above is to be seen as an approximation and specific data for deliveries may differ from the values given.

Zinc-Oxide Surge Arrester TEXLIM Q-C

Protection of switchgear, transformers and other equipment in high voltage systems against atmospheric and switching overvoltages.
- in areas with very high lightning intensity
- where grounding or shielding conditions are poor or incomplete
- for important installations
- where energy requirements are very high (e.g. very long lines, capacitor protection).
- Specially suited to extreme seismic zones.

Superior where low weight, non-fragility and additional personnel safety is required.

Other data can be ordered on request. Please contact your local sales representative.

Brief performance data

Arrester classification as per IEC 60099-4 Ed 3.0	Station; SM
Arrester classification as per IEEE Std C62.11-2012	Station
System voltages (U_s)	123 - 420 kV
Rated voltages (U_r)	90 - 420 kV
Nominal discharge current (IEC)	10 kA_{peak}
Lightning impulse classifying current (ANSI/IEEE)	10 kA_{peak}
Charge, energy and current withstand:	
Repetitive charge transfer rating, Q_{rs} (IEC)	2.0 C
Thermal energy rating, W_{th} (IEC)	8 kJ/kV (U_r)
Single impulse energy capability (2 ms to 4 ms impulse)	4.5 kJ/kV (U_r)
Discharge current withstand strength:	
High current 4/10 µs	100 kA_{peak}
Low current 2000 µs, (based on Q_{rs})	1 600 A_{peak}
Energy class as per IEEE standard (switching surge energy rating)	E
Single-impulse withstand rating as per IEEE standard	2.2 C
Repetitive charge transfer test value - sample tests on all manufactured block batches	2.7 C
Short-circuit/Pressure relief capability	80 $kA_{rms(sym)}$
Mechanical strength:	
Specified long-term load (SLL)	21000 Nm
Specified short-term load (SSL)	40000 Nm
Service conditions:	
Ambient temperature	-50 °C to +45 °C
Design altitude	max. 1000 m
Frequency	15 - 62 Hz
Line discharge class (as per IEC60099-4, Ed. 2.2)	Class 3

Further data according to the IEEE standard can be supplied on request

1) The continuous operating voltages Uc (as per IEC) and MCOV (as per IEEE) differ only due to deviations in type test procedures.
Uc has to be considered only when the actual system voltage is higher than the tabulated.
Any arrester with U_r higher than or equal to the actual system voltage divided by √3 can be selected.

2) With prior duty equal to the thermal energy rating of 11 kJ/kV (U_r).

Arresters with lower or higher rated voltages may be available on request for special applications.

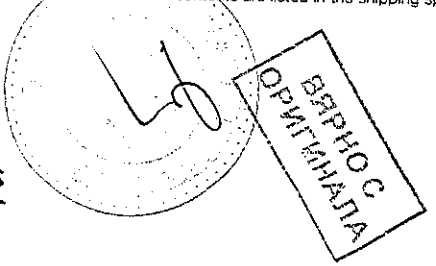
Each crate contains a certain number of arrester units and accessories for assembly and erection. A packing list is attached externally on each crate.

Each separate crate is numbered and the numbers of all crates and their contents are listed in the shipping specification. ABB reserves the right to pack arresters in the most effective/economic combination. Alternate or non-standard crates may involve additional charges.

The table above is to be seen as an approximation and specific data for deliveries may differ from the values given.



Zinc-Oxide Surge Arrester TEXLIM P-C

Protection of switchgear, transformers and other equipment in high voltage systems against atmospheric and switching overvoltages.
- in areas with very high lightning intensity
- where grounding or shielding conditions are poor or incomplete
- for important installations
- where energy requirements are very high (e.g. very long lines, capacitor protection).
- Specially suited to extreme seismic zones.

Superior where low weight, non-fragility and additional personnel safety is required.

Other data can be ordered on request. Please contact your local sales representative.

Brief performance data

Arrester classification as per IEC 60099-4 Ed 3.0	Station; SH
Arrester classification as per IEEE Std C62.11-2012	Station
System voltages (Us)	245 - 550 kV
Rated voltages (U_r)	180 - 444 kV
Nominal discharge current (IEC)	20 kA_{peak}
Lightning impulse classifying current (ANSI/IEEE)	10/15 kA_{peak}
Charge, energy and current withstand:	
Repetitive charge transfer rating, Q_{rs} (IEC)	3.2 C
Thermal energy rating, W_{th} (IEC)	11 kJ/kV (U_r)
Single impulse energy capability (2 ms to 4 ms impulse)	7 kJ/kV (U_r)
Discharge current withstand strength:	
High current 4/10 µs	100 kA_{peak}
Low current 2000 µs, (based on Q_{rs})	1 600 A_{peak}
Energy class as per IEEE standard (switching surge energy rating)	G
Single-impulse withstand rating as per IEEE standard	3.2 C
Repetitive charge transfer test value - sample tests on all manufactured block batches	4.0 C
Short-circuit/Pressure relief capability	80 $kA_{rms(sym)}$
Mechanical strength:	
Specified long-term load (SLL)	21 000 Nm
Specified short-term load (SSL)	40 000 Nm
Service conditions:	
Ambient temperature	-50 °C to +45 °C
Design altitude	max. 1 000 m
Frequency	15 - 62 Hz
Line discharge class (as per IEC60099-4, Ed. 2.2)	Class 4

Further data according to the IEEE standard can be supplied on request

1) The continuous operating voltages Uc (as per IEC) and MCOV (as per IEEE) differ only due to deviations in type test procedures
Uc has to be considered only when the actual system voltage is higher than the tabulated.
Any arrester with U_s higher than or equal to the actual system voltage divided by √3 can be selected.

2) With prior duty equal to the thermal energy rating of 8 kJ/kV (U_r).

Arresters with lower or higher rated voltages may be available on request for special applications

1) The continuous operating voltages Uc (as per IEC) and MCOV (as per IEEE) differ only due to deviations in type test procedures.
Uc has to be considered only when the actual system voltage is higher than the tabulated.
Any arrester with U_r higher than or equal to the actual system voltage divided by √3 can be selected.

2) With prior duty equal to the thermal energy rating of 1.1 kJ/kV (U_r).

Arresters with lower or higher rated voltages may be available on request for special applications.

Each crate contains a certain number of arrester units and accessories for assembly and erection. A packing list is attached externally on each crate.

Each separate crate is numbered and the numbers of all crates and their contents are listed in the shipping specification. ABB reserves the right to pack arresters in the most effective/economic combination. Alternate or non-standard crates may involve additional charges.

The table above is to be seen as an approximation and specific data for deliveries may differ from the values given.

Zinc Oxide Surge Arrester EXLIM R

Protection of switchgear, transformers and other equipment in high voltage systems against atmospheric and switching overvoltages. For use when requirements of lightning intensity, energy capability and pollution are moderate.

Other data can be ordered on request. Please contact your local sales representative.

Brief performance data

Arrester classification as per IEC 60099-4 Ed 3.0	Station; SL
Arrestor classification as per IEEE Std C62.11-2012	Station
System voltages (U_s)	52 - 170 kV
Rated voltages (U_r)	42 - 168 kV
Nominal discharge current (IEC)	10 kA_{peak}
Lightning impulse classifying current (ANSI/IEEE)	10 kA_{peak}
Charge, energy and current withstand:	
Repetitive charge transfer rating, Q_{rs} (IEC)	1.2 C
Thermal energy rating, W_{th} (IEC)	5 kJ/kV (U_r)
Single impulse energy capability (2 ms to 4 ms impulse)	2.5 kJ/kV (U_r)
Discharge current withstand strength:	
High current 4/10 µs	100 kA_{peak}
Low current 2000 µs, (based on Q_{rs})	600 A_{peak}
Energy class as per IEEE standard (switching surge energy rating)	-
Single-impulse withstand rating as per IEEE standard	1.2 C
Repetitive charge transfer test value - sample tests on all manufactured block batches	1.5 C
Short-circuit/Pressure relief capability	50 $kA_{rms(sym)}$
Mechanical strength:	
Specified long-term load (SLL)	3000 Nm
Specified short-term load (SSL)	7500 Nm
Service conditions:	
Ambient temperature	-50 °C to +45 °C
Design altitude	max. 1000 m
Frequency	15 - 62 Hz
Line discharge class (as per IEC60099-4, Ed. 2.2)	Class 2

Further data according to the IEEE standard can be supplied on request

Each crate contains a certain number of arrester units and accessories for assembly and erection. A packing list is attached externally on each crate.

Each separate crate is numbered and the numbers of all crates and their contents are listed in the shipping specification. ABB reserves the right to pack arresters in the most effective/economic combination. Alternate or non-standard crates may involve additional charges.

The table above is to be seen as an approximation and specific data for deliveries may differ from the values given.

Zinc Oxide Surge Arrester EXLIM Q-E

Protection of switchgear, transformers and other equipment in high voltage systems against atmospheric and switching overvoltages.
- in areas with high lightning intensity and high energy requirements.
- where grounding or shielding conditions are poor or incomplete.

Other data can be ordered on request. Please contact your local sales representative.

Brief performance data

Arrestor classification as per IEC 60099-4 Ed 3.0	Station; SM
Arrester classification as per IEEE Std C62.11-2012	Station
System voltages (U_s)	52 - 245 kV
Rated voltages (U_r)	43 - 228 kV
Nominal discharge current (IEC)	10 kA_{peak}
Lightning impulse classifying current (ANSI/IEEE)	10 kA_{peak}
Charge, energy and current withstand:	
Repetitive charge transfer rating, Q_{rs} (IEC)	2.0 C
Thermal energy rating, W_{th} (IEC)	8 kJ/kV (U_r)
Single impulse energy capability (2 ms to 4 ms impulse)	4.5 kJ/kV (U_r)
Discharge current withstand strength:	
High current 4/10 µs	100 kA_{peak}
Low current 2000 µs, (based on Q_{rs})	1000 A_{peak}
Energy class as per IEEE standard (switching surge energy rating)	E
Single-impulse withstand rating as per IEEE standard	2.2 C
Repetitive charge transfer test value - sample tests on all manufactured block batches	2.7 C
Short-circuit/Pressure relief capability	65 $kA_{rms(sym)}$
Mechanical strength:	
Specified long-term load (SLL)	3000 Nm
Specified short-term load (SSL)	7500 Nm
Service conditions:	
Ambient temperature	-50 °C to +45 °C
Design altitude	max. 1000 m
Frequency	15 - 62 Hz
Line discharge class (as per IEC60099-4, Ed. 2.2)	Class 3

Further data according to the IEEE standard can be supplied on request

1) The continuous operating voltages Uc (as per IEC) and MCOV (as per IEEE) differ only due to deviations in type test procedures.
U_c has to be considered only when the actual system voltage is higher than the tabulated.
Any arrester with U_r higher than or equal to the actual system voltage divided by √3 can be selected.

2) With prior duty equal to the thermal energy rating of 8 kJ/kV (U_r).

3) Arresters for system voltages 36 kV or below can be supplied, on request, when the order also includes arresters for higher system voltages.

Arresters with lower or higher rated voltages may be available on request for special applications.

Each crate contains a certain number of arrester units and accessories for assembly and erection. A packing list is attached externally on each crate.

Each separate crate is numbered and the numbers of all crates and their contents are listed in the shipping specification. ABB reserves the right to pack arresters in the most effective/economic combination. Alternate or non-standard crates may involve additional charges.

The table above is to be seen as an approximation and specific data for deliveries may differ from the values given.

Zinc Oxide Surge Arrester EXLIM Q-D

Protection of switchgear, transformers and other equipment in high voltage systems against atmospheric and switching overvoltages.
- in areas with high lightning intensity and high energy requirements.
- where grounding or shielding conditions are poor or incomplete.

Other data can be ordered on request. Please contact your local sales representative.

Brief performance data

Arrester classification as per IEC 60099-4 Ed 3.0	Station: SM
Arrester classification as per IEEE Std C62.11-2012	Station
System voltages (U_s)	170 - 420 kV
Rated voltages (U_r)	132 - 420 kV
Nominal discharge current (IEC)	10 kA_{peak}
Lightning impulse classifying current (ANSI/IEEE)	10 kA_{peak}
Charge, energy and current withstand:	
Repetitive charge transfer rating, Q_{rs} (IEC)	2.0 C
Thermal energy rating, W_{th} (IEC)	8 kJ/kV (U_r)
Single impulse energy capability (2 ms to 4 ms impulse)	4.5 kJ/kV (U_r)
Discharge current withstand strength:	
High current 4/10 µs	100 kA_{peak}
Low current 2000 µs, (based on Q_{rs})	1000 A_{peak}
Energy class as per IEEE standard (switching surge energy rating)	E
Single-impulse withstand rating as per IEEE standard	2.2 C
Repetitive charge transfer test value - sample tests on all manufactured block batches	2.7 C
Short-circuit/Pressure relief capability	65 $kA_{rms(sym)}$
Mechanical strength:	
Specified long-term load (SLL)	8000 Nm
Specified short-term load (SSL)	20000 Nm
Service conditions:	
Ambient temperature	-50 °C to +45 °C
Design altitude	max. 1000 m
Frequency	15 - 62 Hz
Line discharge class (as per IEC60099-4, Ed. 2.2)	Class 3

Further data according to the IEEE standard can be supplied on request

[1] The continuous operating voltages U_c (as per IEC) and MCOV (as per IEEE) differ only due to deviations in type test procedures.
U_c has to be considered only when the actual system voltage is higher than the tabulated.
Any arrester with U_c higher than or equal to the actual system voltage divided by √3 can be selected.

[2] With prior duty equal to the thermal energy rating of 8 kJ/kV (U_r).

Arresters with lower or higher rated voltages may be available on request for special applications.

Zinc Oxide Surge Arrester EXLIM P

Protection of switchgear, transformers and other equipment in high voltage systems against atmospheric and switching overvoltages.
- in areas with very high lightning intensity.
- where grounding or shielding conditions are poor or incomplete.
- for important installations.
- where energy requirements are very high (e.g. very long lines, capacitor protection).

Other data can be ordered on request. Please contact your local sales representative.

Brief performance data

Arrester classification as per IEC 60099-4 Ed 3.0	Station; SH
Arrester classification as per IEEE Std C62.11-2012	Station
System voltages (U_s)	52 - 550 kV
Rated voltages (U_r)	42 - 444 kV
Nominal discharge current (IEC)	20 kA_{peak}
Lightning impulse classifying current (ANSI/IEEE)	10/15 kA_{peak}
Charge, energy and current withstand:	
Repetitive charge transfer rating, Q_{rs} (IEC)	3.2 C
Thermal energy rating, W_{th} (IEC)	11 kJ/kV (U_r)
Single impulse energy capability (2 ms to 4 ms impulse)	7 kJ/kV (U_r)
Discharge current withstand strength:	
High current 4/10 µs	100 kA_{peak}
Low current 2000 µs, (based on Q_{rs})	1600 A_{peak}
Energy class as per IEEE standard (switching surge energy rating)	G
Single-impulse withstand rating as per IEEE standard	3.2 C
Repetitive charge transfer test value - sample tests on all manufactured block batches	4.0 C
Short-circuit/Pressure relief capability	80 $kA_{rms(sym)}$
Mechanical strength:	
Specified long-term load (SLL)	8000 Nm
Specified short-term load (SSL)	20000 Nm
Service conditions:	
Ambient temperature	-50 °C to +45 °C
Design altitude	max. 1000 m
Frequency	15 - 62 Hz
Line discharge class (as per IEC60099-4, Ed. 2.2)	Class 4

1) The continuous operating voltages U_c (as per IEC) and MCOV (as per IEEE) differ only due to deviations in type test procedures.
U_r has to be considered only when the actual system voltage is higher than the tabulated.
Any arrester with Uc higher than or equal to the actual system voltage divided by √3 can be selected.

2) With prior duty equal to the thermal energy rating of 11 kJ/kV (U_r).

3) Arresters for system voltages 36 kV or below can be supplied, on request, when the order also includes arresters for higher system voltages.

Arresters with lower or higher rated voltages may be available on request for special applications.

Each crate contains a certain number of arrester units and accessories for assembly and erection. A packing list is attached externally on each crate.

Each separate crate is numbered and the numbers of all crates and their contents are listed in the shipping specification. ABB reserves the right to pack arresters in the most effective/economic combination. Alternate or non-standard crates may involve additional charges.

i The table above is to be seen as an approximation and specific data for delivenes may differ from the values given.

Zinc Oxide Surge Arrester EXLIM T

Protection of switchgear, transformers and other equipment in high voltage systems against atmospheric and switching overvoltages.
- in areas with very high lightning intensity
- where grounding or shielding conditions are poor or incomplete
- for important installations
- where energy requirements are very high (e.g. very long lines, capacitor protection).

Other data can be ordered on request. Please contact your local sales representative.

Brief performance data

Arrester classification as per IEC 60099-4 Ed 3.0	Station; SH
Arrester classification as per IEEE Std C62.11-2012	Station
System voltages (U_s)	245 - 800 kV
Rated voltages (U_r)	180 - 624 kV
Nominal discharge current (IEC)	20 kA_{peak}
Lightning impulse classifying current (ANSI/IEEE)	10/15/20 kA_{peak}
Charge, energy and current withstand:	
Repetitive charge transfer rating, Q_{rs} (IEC)	5.2 C
Thermal energy rating, W_{th} (IEC)	15 kJ/kV (U_r)
Single impulse energy capability (2 ms to 4 ms impulse)	11 kJ/kV (U_r)
Discharge current withstand strength:	
High current 4/10 µs	150 kA_{peak}
Low current 2000 µs, (based on Q_{rs})	2600 A_{peak}
Energy class as per IEEE standard (switching surge energy rating)	J
Single-impulse withstand rating as per IEEE standard	5.2 C
Repetitive charge transfer test value - sample tests on all manufactured block batches	5.2 C
Short-circuit/Pressure relief capability	80 $kA_{rms(sym)}$
Mechanical strength:	
Specified long-term load (SLL)	8000 Nm
Specified short-term load (SSL)	20000 Nm
Service conditions:	
Ambient temperature	-50 °C to +45 °C
Design altitude	max. 1000 m
Frequency	15 - 62 Hz
Line discharge class (as per IEC60099-4, Ed. 2.2)	Class 5

Further data according to the IEEE standard can be supplied on request

1) The continuous operating voltages U_c (as per IEC) and MCOV (as per IEEE) differ only due to deviations in type test procedures.
U_c has to be considered only when the actual system voltage is higher than the tabulated.
Any arrester with Uc higher than or equal to the actual system voltage divided by √3 can be selected.

2) With prior duty equal to the thermal energy rating of 15 kJ/kV (U_r)

Arresters with lower or higher rated voltages may be available on request for special applications

Each crate contains a certain number of arrester units and accessories for assembly and erection. A packing list is attached externally on each crate.

Each separate crate is numbered and the numbers of all crates and their contents are listed in the shipping specification. ABB reserves the right to pack arresters in the most effective/economic combination. Alternate or non-standard crates may involve additional charges.

The table above is to be seen as an approximation and specific data for deliveries may differ from the values given.

EXCOUNT

Surge arrester monitors matched with the surge arresters

With our state-of-the-art product family EXCOUNT, ABB has the full range of counters and monitors to cater for all customer needs – from simple discharge operation count (EXCOUNT-C) through leakage current measurement (EXCOUNT-I) to on-line monitoring and diagnostics (EXCOUNT-II).

	EXCOUNT-C	EXCOUNT-I	EXCOUNT-II
			Surge registration			
Number of impulses	Yes	Yes	Yes
Impulse amplitude	-	-	Yes
Leakage current measurement			
Total current	-	Yes (also available without)	Yes
Resistive leakage current	-	-	Yes (also available without)
Display	6-digit, electromechanical counter	6 digit, Ch-LCD	Remote reading, PC connectivity
Power supply	Not applicable	Solar panel	Solar panel and field probe

EXCOUNT

Monitoring the health of surge arresters

Well-designed and tested, ABB surge arresters are maintenance-free and can reasonably be expected to have a long service life. Nevertheless, considering the type of expensive equipment which an arrester is protecting, together with how costly and devastating an unplanned power outage can be, there are good reasons for "monitoring" the condition of arresters.

Surge arresters present a high impedance at normal service voltage such that they behave as an insulator for the majority of their life. This is necessary to assure a long life for the arrester itself as well as stability of the electrical network as a whole. A deterioration of an arrester's insulating properties is therefore important to detect early before the situation becomes acute.

In order to truly evaluate the health of an arrester, testing of the kind made as routine during manufacture would need to be performed. However, such testing is not practical to make in the field and removal of the arrester to a HV lab is deemed uneconomic. Instead some kind of in-service diagnostic is required.

Surge registration

The primary reason for the use of surge counters on modern gapless ZnO arresters is to check if a particular transmission line or phase suffers from an exceptionally high number of overvoltages leading to arrester operation — lightning faults on a line, for example. If this is the case, whilst it validates the need for the arresters, use of some preventative countermeasures may be warranted to limit the number of surges. A sudden increase in the counting rate may also indicate an internal arrester fault, in which case the arrester should be investigated further.

However, simple surge counters tell only part of the story, as they only register the number of surges according to their operating characteristic. The user therefore has no way of telling the magnitude of the surge and if it was significant, nor when it occurred and if it was coincident with a system event.

Leakage current measurement

Surge counters can be complimented with the facility to measure leakage currents (total and/or resistive), with the intention of monitoring and diagnosing the condition of the arrester and its state of fitness for continued service. However it is important to understand the validity of the information provided.

At continuous operating voltage (U_c), a metal-oxide varistor acts as a capacitor, leading to a predominantly capacitive component of current and a significantly smaller resistive part. For a complete surge arrester, the capacitive current is further dependent on stray capacitances, pollution currents on the insulator surface, number of varistor columns in parallel and the actual operating voltage. Meanwhile the small resistive component of the leakage current is temperature and voltage dependant.

Since the capacitive component of the current dominates so greatly, the total leakage current measured on a basic mA-meter will be very sensitive to the installation; making interpretation of the readings difficult. Furthermore, the capacitive current does not change significantly due to deterioration of the voltage-current characteristic of the surge arrester. Consequently, measurement of capacitive current cannot reliably indicate the condition of metal-oxide arresters. Nevertheless, increasing values may be of some use in indicating that cleaning of the insulators is necessary.

EXCOUNT
Monitoring the health of surge arresters

Instead, it is generally recognized (IEC 60099-5) that the only reliable indicator for the condition of a gapless arrester that can be assessed during normal service is to measure the resistive component of the leakage current (or estimate it from the 3rd harmonic). The obtained value may then be compared with the maximum allowable resistive current as given by the manufacturer under prevailing service conditions i.e. temperature and applied voltage.

Remote reading with EXCOUNT-II

If a metal-oxide varistor ages or is damaged by impulses etc, the arrester resistive leakage current, and hence power losses, increase permanently. This may result in an increase in temperature, which in turn, increases the leakage current and so on until a so-called thermal runway occurs. Early detection of a possible harmful increase may prevent a failure and subsequent unplanned shutdown. Hence, to provide true diagnostics, a good monitor must be able to detect the arrester leakage current and isolate and measure the resistive component flowing internally.

Diagnostic plan

A surge arrester does not contain any moving parts or items that can break. Consequently there is nothing to maintain, adjust, correct or repair, which is why there is normally no need to perform any form of periodical checking or monitoring. In general, a correctly chosen and installed arrester is maintenance free during its entire lifetime. A correctly chosen arrester in this context means that its electrical and mechanical characteristics are matched to actual service conditions.

Nonetheless, since external factors can place stresses on the arrester, potentially leading to its deterioration and ultimato overload, it may be prudent to draw up a schedule for regular checks. Such consideration is all the more important if an unplanned outage is unacceptable for reasons of system stability or economics. The older the arrester, the more regular these checks may need to be, since the statistical risk for overload increases with age.

As a guide, the following strategy is proposed to be made at regular intervals as required and determined by site availability and importance:

- Visual inspection and possible cleaning
- Diagnostics in advance of the designated lighting season and thereafter following periods with bad weather conditions.
- Diagnostics after special fault conditions causing flashover in the network or TOV's of high amplitude and/or long duration.

Because of their nature, old-style gapped arresters should be removed as soon as possible as part of a scheduled replacement program. Their age and inherent design does not warrant detailed evaluation. Early models of gapless arresters may require additional visual checks to look for signs of mechanical or physical deterioration as well as monitoring of the internals. Newly purchased arresters can also benefit from diagnostic monitoring right from first installation since this permits easy trend analysis to detect potential deterioration later on in its service life.

EXCOUNT
When safety comes first

EXCOUNT draws upon over 75 years of experience by ABB in the development of arresters and associated accessories. Safety, functionality and longevity are key elements which are given priority in selection and design of components. In stark contrast to many other competing products, EXCOUNT has not neglected short-circuit safety which lies inherent in the design concept.

The EXCOUNT family is characterized by:

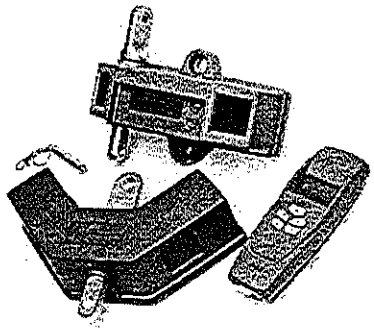
Highest personnel safety
- Explosion-proof for short-circuit currents up to 65 kA.
- Same safe performance as ABB arresters.

Negligible residual voltage
- Does not reduce protection margins.
- Minimized risk for injury in case of accidental contact during surges.

Maintenance free
- Sealed components.
- Requires no external power supply.

Long life
- Moulded components, non-sensitive to humidity or temperature variations.

Universal application
- All makes and types of gapless surge arresters.
- All weather and temperature conditions.



Design

The use of an impulse current transformer with a single-turn primary ensures that the voltage drop across the counter is negligible, even at the highest impulse currents encountered in service. This leads to added personnel safety and no increase in the protection level of the arrester. Since no gaps or series impedance are used, there is no risk of internal arcing and consequent explosive failure in the event of a short-circuit following an arrester failure.

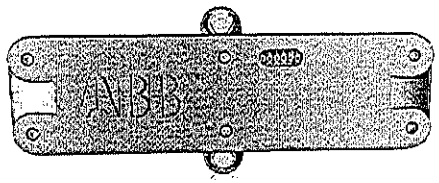
One further common feature with the entire EXCOUNT family is that all internal components are fully encapsulated in polymer. This provides sealing to IP67, which ensures no harmful ingress of dust or moisture as well as providing personal safety through complete protection against contact with the internals.

EXCOUNT is available in different variants, depending on the user's needs: simple, basic or extensive.

Surge counter EXCOUNT-C

EXCOUNT-C
Technical data

EXCOUNT-C is a simple surge counter with all the essentials for easy installation and highest personnel safety. The counter is maintenance free; powered by the surge current and suitable for all weather and temperature conditions.



Design features
EXCOUNT-C is to be fitted in the earth circuit between the arrester and ground. For simplicity, the EXCOUNT-C does not have a termination point for the earth cable. Instead an opening is provided to draw the entire earth conductor from the arrester completely through and down to ground. In case the conductor is too large to fit through the hole, an optional conductor kit may be ordered separately.

The secondary circuit is connected to a mechanical counting relay and all components are totally sealed in polymer. A viewing window permits easy reading of the six-digit cyclometer-type counter.

Surge registration
The counting threshold for EXCOUNT-C is adapted for gapless surge arresters. Only pulses that are considered significant to the arrester capability and life are therefore registered.

Maintenance free
A robust plastic casing is fitted over the encapsulated internals, which makes EXCOUNT-C non-sensitive to humidity or temperature variations. It can be exposed to all environments regardless of weather and temperature conditions. The current transformer secondary output is sufficient for driving the counter and an external supply source is hence not needed.

General

Item number	1HSA448000-A
Climatic conditions	Sealed water-tight design, IP67
Short-circuit capability	65 kA according to IEC 60099-4
Power supply	Impulse current

Surge registration

Minimum counting threshold (8/20 µs)	1.5 kA

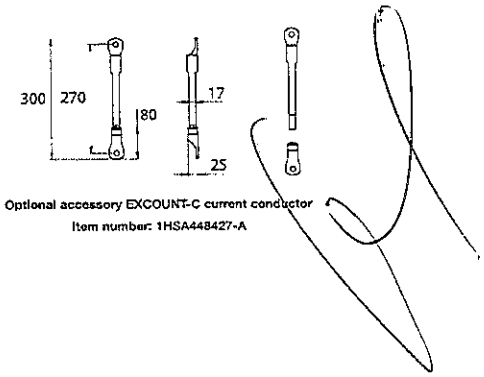
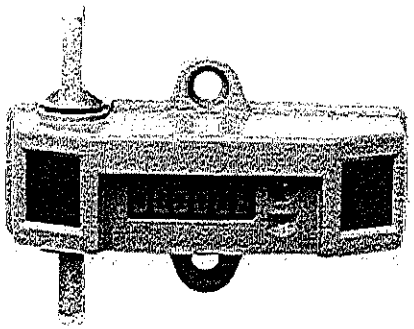
Dimensions



Optional accessory EXCOUNT-C current conductor
Item number: 1HSA448427-A

Surge counter EXCOUNT-I
with mA-meter

EXCOUNT-I is a surge counter with basic leakage current measurement function. The counter provides a number of unique features such as short-circuit safety and a well proven electronic display which is easy to read, even in direct sunlight. EXCOUNT-I is specially designed for use with all makes and types of gapless arresters and in diverse environments.



Design features.
As with all surge counters from ABB, EXCOUNT-I does not negatively affect the residual voltage of the arrester.
EXCOUNT-I is housed in a sealed, weather-proof case, suitable for outdoor use and proven to match the short circuit capability of the arresters. EXCOUNT-I has been designed for highest personal safety and has been successfully short circuit tested at 65 kA.

EXCOUNT-I requires no external power supply as it incorporates its own internal power source in the form of a high-efficiency capacitor charged by solar cells.

The electronic display is of Cholesteric Liquid Crystal Display type. This ensures highest readability, even in direct sunlight. The display is Bi-stable, which means that power is only required during refresh of the display.

Surge registration
EXCOUNT-I registers the surge each time the arrester has discharged a current over 10 A. The accumulated number of surges is continuously shown on the electronic display.

Leakage current measurement
ABB's unique design ensures that total leakage current through the arrester can be measured without risking personnel safety.

The measurement is initiated by triggering a light sensitive diode using a standard laser pointer. This will initiate EXCOUNT-I to start measuring the total leakage current for several cycles and shortly thereafter display the average value (in mA). The counter will then automatically return to its normal state and display number of impulses. Thus, the measurement can be made at a discreet distance without coming into direct contact with the equipment.

Maintenance free
EXCOUNT-I is a maintenance free product in outdoor applications. The display and solar panels might however need to be wiped off before measurement in extremely polluted conditions.

EXCOUNT-I
Technical data

General

Climatic conditions	Sealed water-tight design, IP67
Short-circuit capability	65 kA according to IEC 60099-4
Power supply	Built-in solar cells (battery alternative for indoor use)

Surge registration

Minimum counting threshold (8/20 µs)	10 A
Surge counting memory capacity	999999 registrations (wrap-around)
Time resolution	< 0.5 s

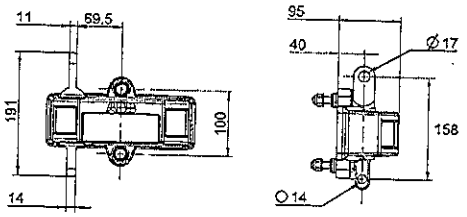
Leakage current measurement

Measuring range of total leakage current	0.1 - 50 mA_{peak}
Measuring frequency range	48 - 62 Hz
Laser pointer wavelength	630 nm

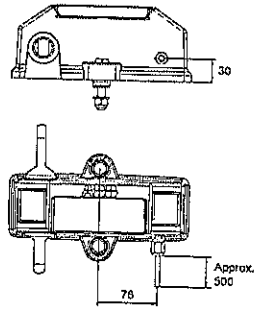
EXCOUNT-I versions
EXCOUNT-I can be supplied with an output connection (auxiliary contact) for interfacing to external signalling equipment. Versions with only surge counting function are also available.

Model	Surge counting	Leakage current measurement	Auxiliary contact	Laser pointer included
1HSA440000-C	Yes	-	-	-
1HSA440000-E	Yes	-	Yes	-
1HSA440000-J	Yes	Yes	-	Yes
1HSA440000-L	Yes	Yes	Yes	Yes

The auxiliary pulse contact is suitable for use with AC or DC voltage (max. 250V, 1A). An auxiliary relay of suitable type must be connected separately to the EXCOUNT-I auxiliary contact (not included as standard).



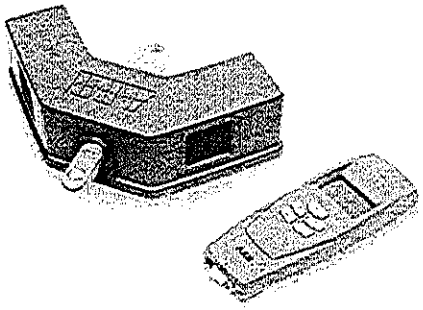
Dimensions



Auxiliary contact brought out via dual-core (2 x 1 mm) cable 1HSA440000-E and 1HSA440000-L

Surge arrester monitor EXCOUNT-II

EXCOUNT-II is our top-of-the line product combining outstanding looks with the most extensive and powerful features. Included are a variety of surge counting features together with all the essential leakage current measurement functions. EXCOUNT-II enables users to keep track of overvoltages in the network as well as providing state-of-the art on-line condition monitoring of arresters.



Design features

EXCOUNT-II is a unique monitoring system, which can be used as an aid to assess the health of the entire substation by monitoring surges transmitted in and out of the network. Each surge arrester is fitted with a sensor, which detects the total number of discharges, the surge amplitude, date and time of occurrence, as well as the leakage current through the arrester. The measurements can be remotely read when convenient with the aid of a hand-held transceiver (and optional external antenna).

Remote reading provides increased personnel safety compared with conventional counters. With a communication distance of up to 60 m (120 m with external antenna), the person does not necessarily have to even be inside the substation perimeter, so saving the need to arrange entry permits or have electrically trained personnel perform the work.

The measured data can then be transferred to a computer for statistical analysis. Included with EXCOUNT-II is specially designed software which facilitates download of the measured data from the transceiver and permits analysis and reporting of the collected information.

Surge registration

EXCOUNT-II does more than just count surges. It also registers the date and time as well as amplitude of the surge each time the arrester has discharged a current over 10 A. Time and amplitude measurement gives the user better information about overvoltages in the network and the operation of the arrester.

Leakage current measurement and condition monitoring

EXCOUNT-II gives the user the possibility to measure both the total leakage current as well as the resistive component of the current through the arrester. Measurement of the resistive current gives a good indication of the arrester's condition and fitness for continued service. The measurement method employed is based on third-harmonic analysis which is considered the most reliable measuring method for condition monitoring according to IEC 60099-5.

Safe and secure

The sensor is housed in a sealed, weather-proof case, suitable for outdoor use and proven to match the short-circuit capability of the arrester to which it is connected. The sensor requires no external power supply as it incorporates its own internal power source in the form of a high-efficiency capacitor automatically charged by solar cells and electric field probe.

EXCOUNT-II
Technical data

General	
Climatic conditions	Sealed water-tight design, IP67
Short-circuit capability	65 kA according to IEC 60099-4
Power supply	Built-in solar cells and field probe (battery alternative for indoor use)

Surge registration	
Minimum counting threshold (8/20 µs)	10 A
Amplitude classification (8/20 µs)	10 - 99 A 100 - 999 A 1000 - 4999 A 5000 - 9999 A > 10000 A
Time stamp	Yes
Time resolution	< 0.5 s
Memory capacity	1000 registrations (wrap-around)

Leakage current measurement	
Measuring range of total leakage current	0.2 - 12 mA_{peak}
Measuring range of resistive leakage current (peak level)	10 - 2000 µA
Measuring frequency range	48 - 62 Hz

EXCOUNT-II versions

EXCOUNT-II are available for two different frequencies depending on national regulations. Contact ABB for guidance.

Sensor

Model	Frequency
1HSA441 000-A	for 868.35 MHz
1HSA441 000-C	for 916.50 MHz

Sensors for inverted mounting

Model	Frequency
1HSA441 000-D	for 868.35 MHz
1HSA441 000-E	for 916.50 MHz

Transceiver model 1

Application: Measuring total leakage current and surge data

Model	Frequency
1HSA442 000-C	for 868.35 MHz
1HSA442 000-E	for 916.50 MHz

Transceiver model 2

Application: Measuring total leakage current, resistive leakage current and surge data.

Model	Frequency
1HSA442 000-A	for 868.35 MHz
1HSA442 000-D	for 916.50 MHz

External antenna

Model	Frequency
1HSA446 000-A	for 868.35 MHz
1HSA446 000-B	for 916.50 MHz

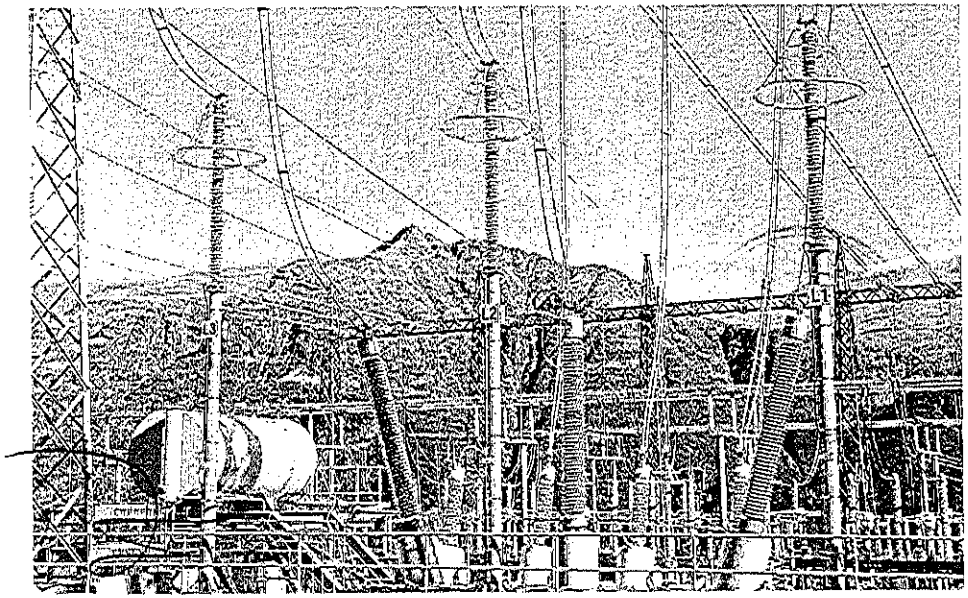
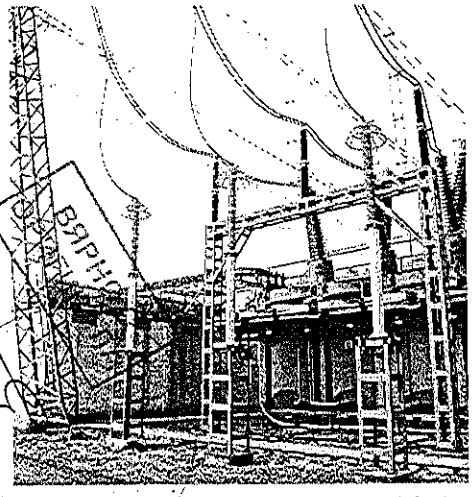
It is recommended that the following form is used when ordering EXLIM/PEXLIM/TEXLIM surge arresters and accessories. Send to fax: +46 (0)240 179 83 or mail to *ordersa.swg@se.abb.com*.

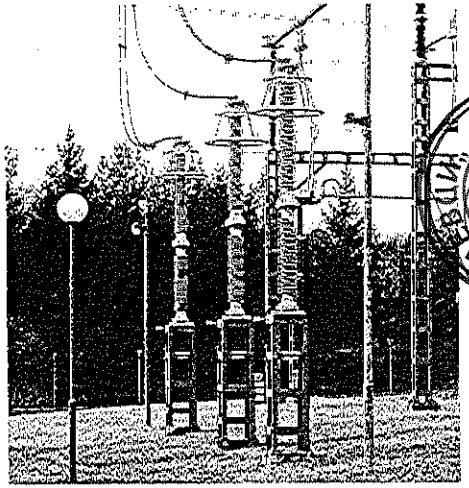
Installations with ABB surge arresters



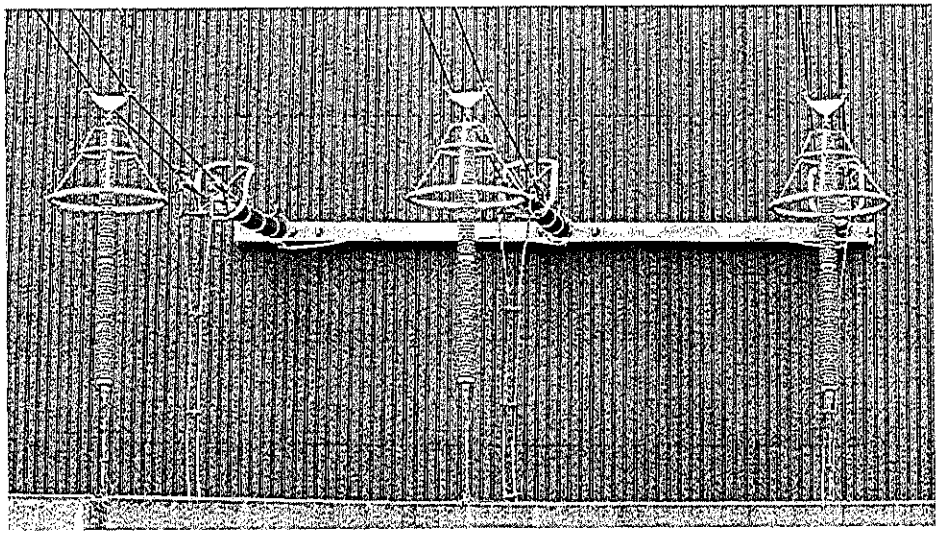
PEXLIM surge arresters protecting a 420 kV power transformer in Norway



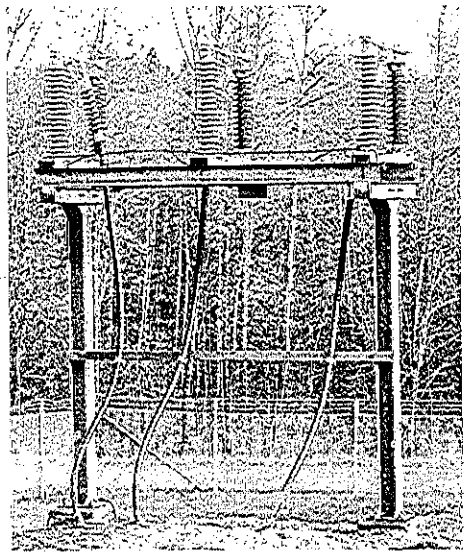
PEXLIM surge arresters protecting a 420 kV power transformer in Sweden



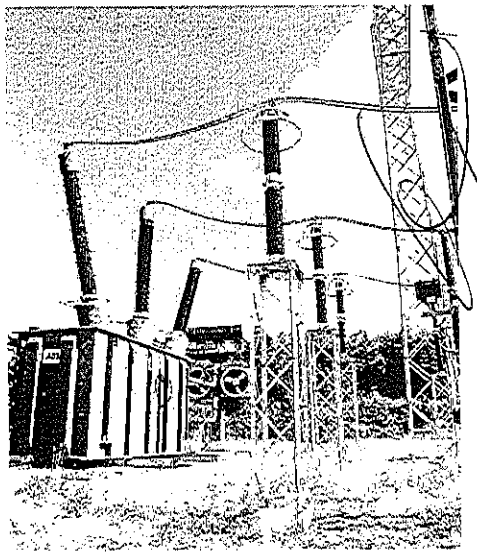
TEXLIM surge arresters connected to the line entrance



PEXLIM surge arresters connected to the 420 kV the secondary winding on a step-up transformer in a nuclear power plant



PEXLIM surge arresters protecting a cable entrance



EXLIM surge arresters protecting a 420 kV power transformer

Dear Customers,

since 1910 we have been supplying the cables which help you to solve your problems in data communication. Enclosed, please, find a new comprehensive and clear guide summary the best for the best list of our company.

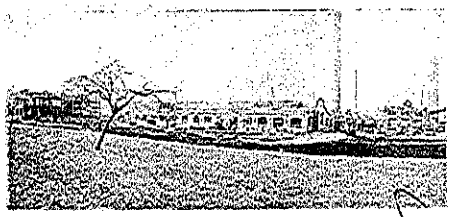
We tried not only to include the standard products that you presently know, carry and buy, but some innovations and brand new products as well. Despite the catalogue is considered as a complete presentation of our production, not all versions can be published and included.

For some special products, please, contact our Sales Departments that will gladly give you any information requested. Let us advise you of the fact that all cable parameters in this catalogue are for information only.

Summary

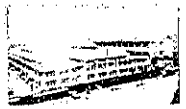
Index

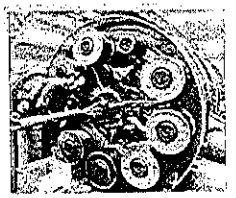
History and present of **KABELOVNA** Děčín Podmokly



KDP was founded in 1909 and 1910 as a branch of the Bergmann cable plant in Berlin, the original name of the company being „Rakousko-Uherská továrna pro dráty a kabely Siemens Podmokly".

From the very outset, the plant manufactured all types of power and communication cables with lead sheaths and the relevant cable tins, as well as mechanical and accessories, cable wires and insulation parts with accessories. Company activity at that time also included projects involving electrical equipment and its installation.





The cable factory came into the hands of Anglo-Continental as part of KDP&B a spol. Prvše when the Four Weddings war the company reconnected the above business. The production of metal communications cables got underway at this new Tuhn cable factory and neighbouring copper works were then merged in 1927 as the „Kabelwerk, Industriale a elektrotechnické závody KABEL-Chuderov, Praha." However the production programme at the cable factory did not change very materially.

The company was nationalised after 1945. It was later incorporated as part of KABLO Kladno and its specialisation simplified. The main production programmes became the manufacture of communication cables and in 1961 KABLO Dolní Lhota became the commonly produced all cables for local and long-distance telecommunication networks using transfer technology. The company was privatised after 1990 became independent again and regained its original name of KABELOVNA Dolní Podmoklí a.s. SIEMENS AG Wien acquired the company in 1992. The result of mutual cooperation here was a considerable modernisation of production technology, the expansion of the range produced and the strengthening of KABELOVNA Dolní Podmoklí a.s. on global markets.

SIEMENS sold its share in KABELOVNA to American venture capital and Bancroft Eastern Europe Fund L.P. in July 2000, before this company in turn sold its share to American company CDT (Cable Design Technology) in December 2001.

CDT then merged with American company BALDER in 2004, the newly-founded company taking on the name of Belden CDT Inc.

2007 the cable works is sold to Nilins Groups, the company is divided into Kabelovna Dolní Podmoklí, s.r.o. and KDP Assembly, s.r.o.

Fibre non-measurable	IEC 60793-1-40	0.1 m
Compound type		Polyethylene (PE)
Temperature range	Installation Operation Storage	-15 to +50 °C -30 to +70 °C +5 to +70 °C
Rated cut through weight	IEC 60794-1-2 E13	1.5 kN
Packaging		4 km per drum
Cable construction maximum length		4 km
Lowest cable diameter		14.3 mm
Cable outer diameter		14.3 ± 0.4 mm
Cable weight		195 kg/km

INSTALLATION AND MANIPULATION

Introduction

It is very easy to damage optical cables if manipulations with them or connection of it mechanical installations given values are not followed.

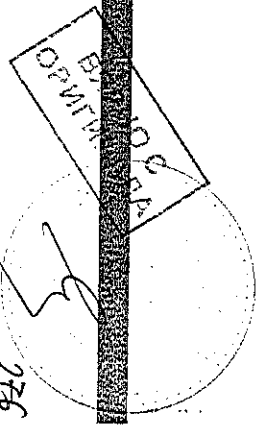
The information stated below should be taken into consideration when installing and manipulating with optical cables. Violating any of the listed rules can result in worsening of the cable's transfer characteristics or it can permanently damage it and shortens its lifetime. The manufacturer can also evolve in a possible but unlikely problem not only related to the installation of new cables but also for possible problems of cables, which have already been installed.

There is but an assumption that the customer has present knowledge about the design of optical cables and the corresponding national as well if necessary, please contact KDK.

Symbols Used

RECOMMENDED

NOT RECOMMENDED



KDP

Manipulation and Storage

The drums with the cables should be thrown from any heights! The drums with optical cables have to always stand on the edges of the head, secured with a wedge to prevent movement. The cable drums when it is not necessary to unclamp the drums with a wedge. The drums are equally secured between each other by [illegible] from counterweights. 1

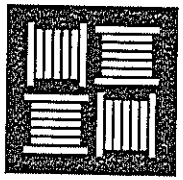
It is possible to store HEAVYTUBE, DIRECT, DUMOF type cables in the open with cables up to drums by laying them horizontal. However the cable has to be screened by drums, temperature and the tensioning of individual cable ends.

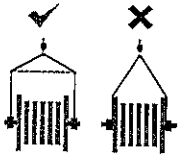
Cables intended for external use only be stored in closed areas between humidity. Cables for universal use cannot be stored [illegible] its outdoor conditions. However, the cable ends have to be waterproof. However, if the cable is in a physical speed, it has to be stored in such a manner as to prevent the adhere of water to the spread.

When manipulating with the drums using a crane, a spacer rail has to be placed between the load bearing means, so that the ropes do not exert pressure on the cable through the side drums. 2

When lifting the drums using a forklift, the drums can only be lifted from the sides and only when the slots of the forklift are long enough for the load of the drum to be positioned on it with a safe overlapping. 3

It is only possible to roll the drums short distances and only via a hand pull the pulley. 4





KDP

Rewinding/Unwinding of Cable

The rewinding and unwinding of cables is only possible in temperatures above 5 °C. If for any reason it is necessary to unwind the cable in a lower temperature, the cable has to be left at a minimum temperature of 20 °C for at least 24 hours beforehand. For rewinding the cable, the winding (winding) direction of the cable, has to be maintained, unwinding cannot form an "8" shape/fig. 4

When unwinding the cable, it is necessary to maintain continuous pull without excessive unwinding various pull not even lead to the loosening of individual coils and to the consequent mutual tender pull possible to the uncontrolled, sharp rigging of the cable, resulting in the damaging of the optical fibers.

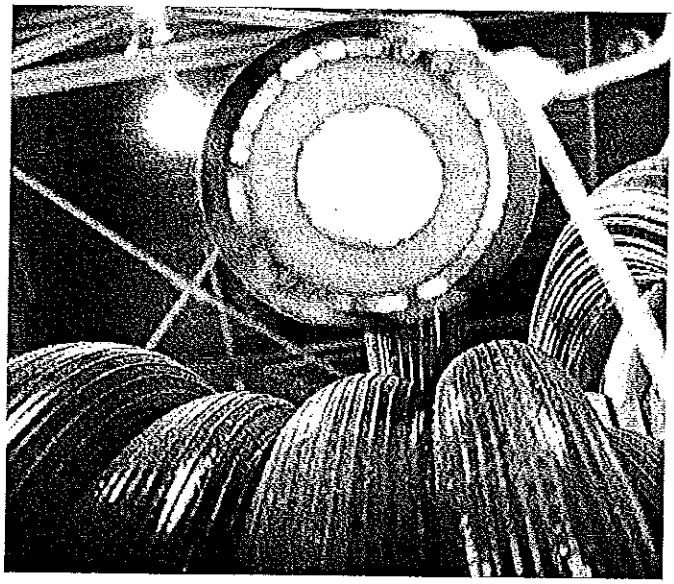
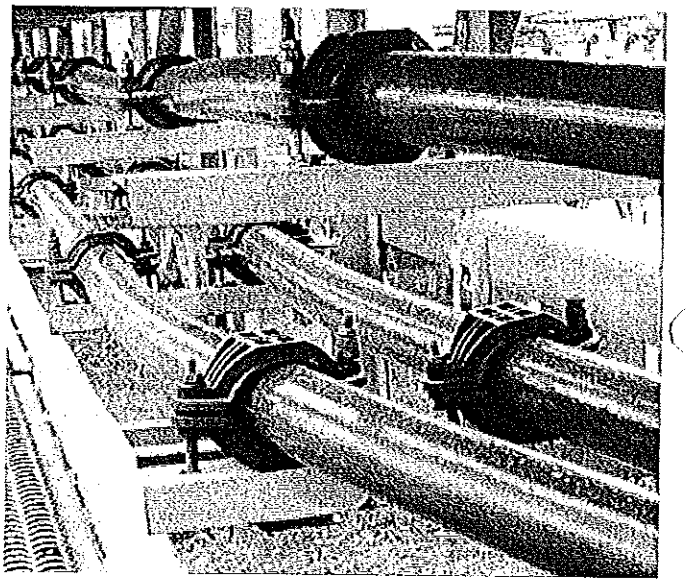
XLPE power cables





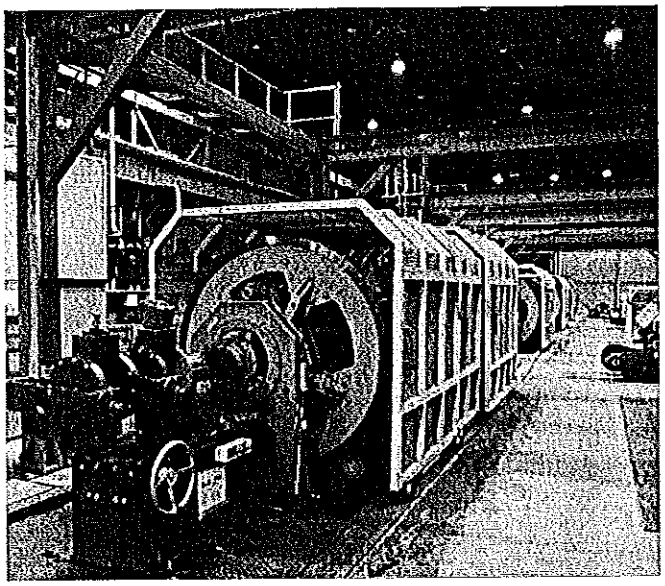
Cables 6-35 kV and 110-220 kV are widely used for electric energy transmission and distribution especially in large cities and at production plants, where electric energy consumption and load density levels are particularly high. Although basic requirements to cables (i.e. reliability, functionality, low costs of maintenance) are obvious they should be thoroughly met because their violation can cause considerable financial losses.

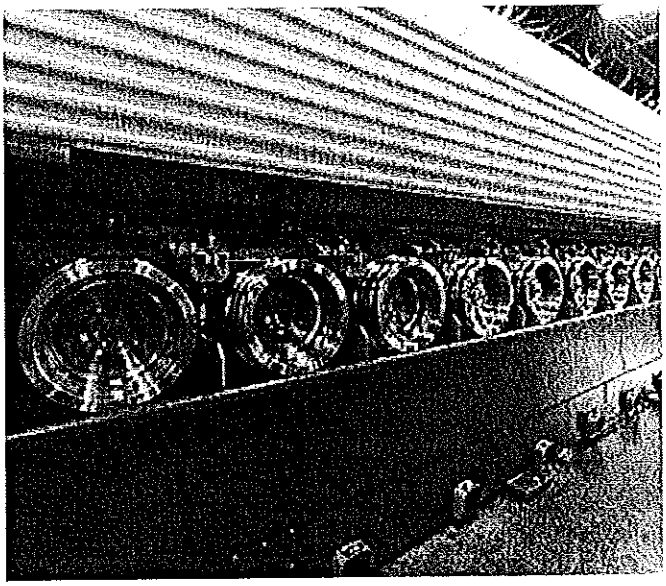
Cable's service life should be long; their function is to provide continuously the consumer with sufficient amount of electric power. Unlike cables with paper-filled or oil-filled insulation that find limited use from year to year, cables with cross-linked polyethylene insulation (Russian designation is – СПЭ, English – XLPE, German-VDE, and Swedish - PEX) meet that requirement in full.

Medium and high voltage XLPE cables due to the design, modern production technology and perfect materials have better electric and mechanical properties and the longest service life among other types of cables of mass production.

XLPE cables transfer capability is substantially higher than that of cables with paper or oil-filled insulation. According to international standards procedure, the cable is designed for continuous service with conductor temperature of 90°C and it is still active under emergency conditions even at higher temperatures, while oil-filled with paper insulation cables can withstand heating only to 70°C.

Production technology





Advantage of XLPE cable is its environmental safety. Absence of liquid inclusions ensures maintaining clean environment, which permits its laying at any projects and service-free maintenance of cable lines.

Due to its single core design, cable laying is easier, as well as the installation accessories, even in the most extreme conditions. Cable laying is still possible at temperatures up to -20°C with polyethylene cable sheath.

XLPE cable production technology was first introduced in the 70s of XX century. The cross-links are a space lattice constructed using formation of longitudinal and transversal ties between macromolecules of polymer. With its physical and electrical properties, cross-linked polymer suits ideally for insulation of medium, high and extra-high voltage cables.

During production of XLPE cable a special attention is paid on the purity and quality of insulating materials, as any inclusions released to the insulation reduces the life of the cable. It is for this reason, the concept of clean rooms, excluding ingress of foreign particles, as well as interaction with reliable suppliers of high quality raw materials, are one of the foundations of the production of reliable cable with a long trouble-free operation time.

It should be stressed that insulation and electrically conducting screens are applied in the process of triple extrusion followed with the simultaneous cross-linking of all three layers. Such a technology ensures high adhesion between the screens and insulation.

Advantages of the enhanced design and modern production technology of XLPE cables have determined their universal application in developed countries and notable decrease in the use of other type cables.

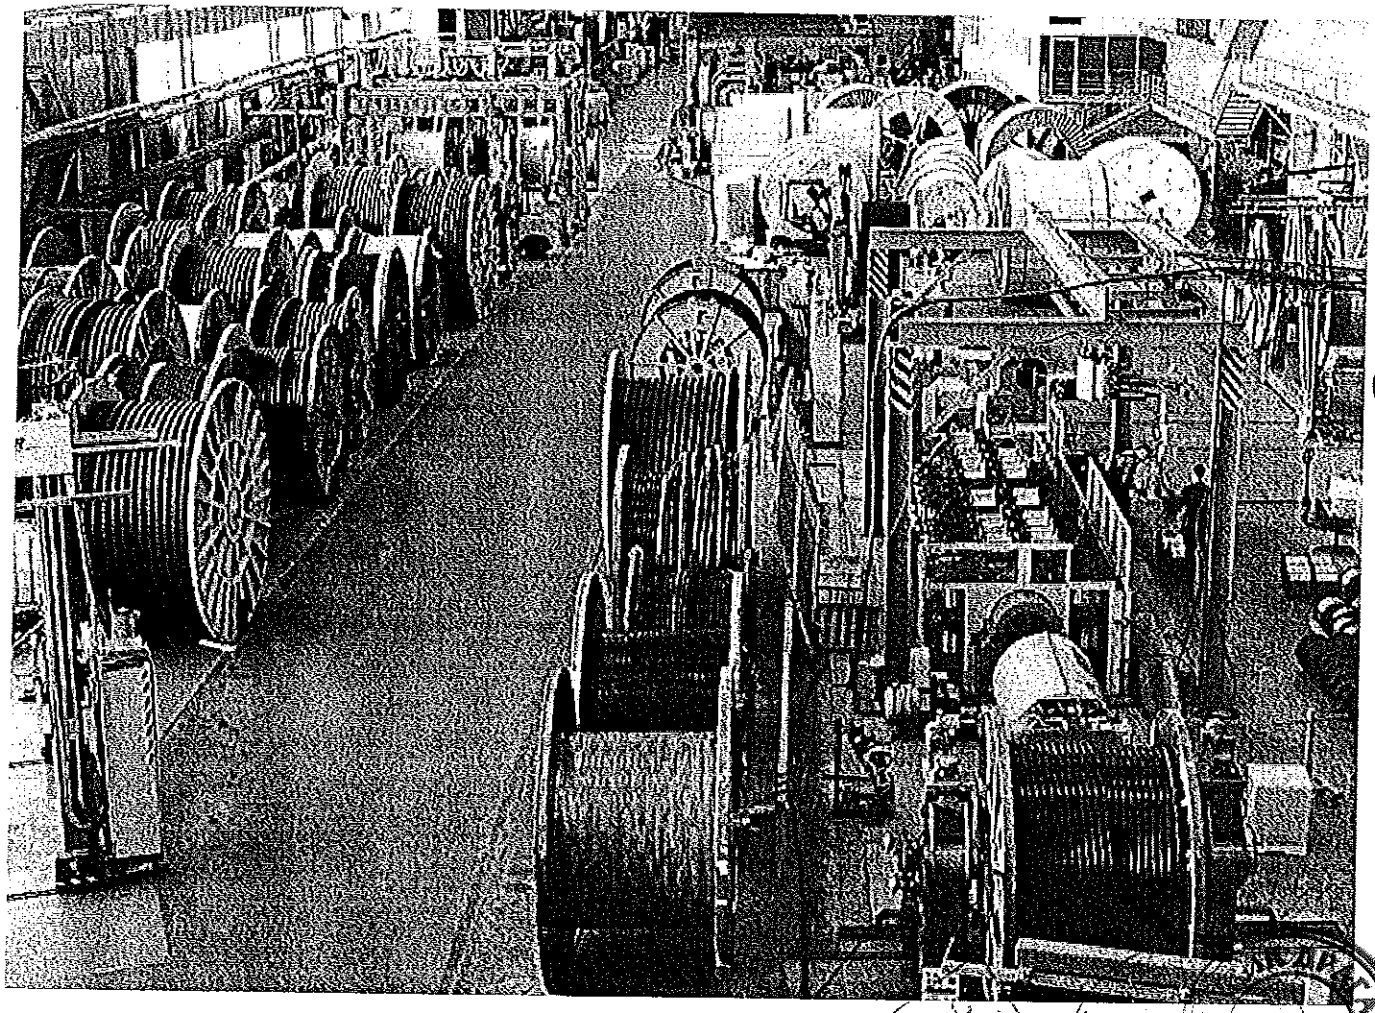
Estralin HVC – a pioneer in Russia's XLPE cable production

The aim of the plant "Estralin High Voltage Cables" (Estralin HVC) is introduction of innovative technologies in the field of power cable production. Providing high-quality production and services, we are helping our customers to raise their competitiveness and reduce the adverse impact upon environment.

Estralin HVC pays attention to technologies development and advancement that provide high quality of manufactured products. Only best materials of leading world manufacturers are used for cable insulation. These are peroxide-cross-linked polyethylenes, triingostable (TSPE) and copolymer (CCPE) polyethylenes. High skilled personnel and the use of high-quality basic materials are the key to perfect production that complies the requirements of advanced Russian and international standards and equals its West-European counterparts.

Continuous control over all phases of the process, starting with the choice of cable and accessories at the design stage and up to commissioning of completed cable line, permits the Company fully satisfy customer's requirements to modern cable lines. A systematic approach of complying international quality standards has been introduced at the factory.

High emphasis is placed upon environmental aspects of the production. Estralin HVC's successes in development and introduction of quality assurance systems and environmental management have been recognized by the largest independent European certification Company, TUV CERT: the Plant was awarded certificates of conformity with regulatory requirements ISO 9001 : 2008.



Main types of products and services

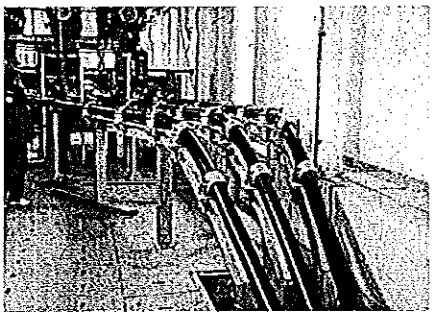
A main activity of Estralin HVC is XLPE cable 6-220 kV production, which use in insulated or earthed networks.

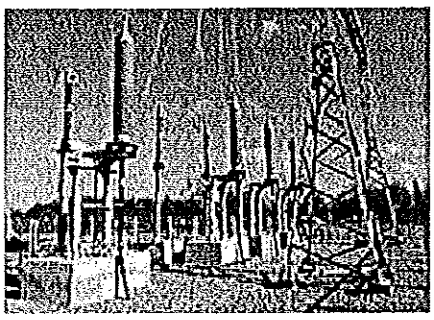
All cables, by their design, technological data and service characteristics comply the international standard requirements: IEC 60502-2 (6-35 kV cables), IEC 60840 (110 kV cables), and IEC 62067 (220 kV cables), as well as with the GOST R certification, including those with regard to fire safety.

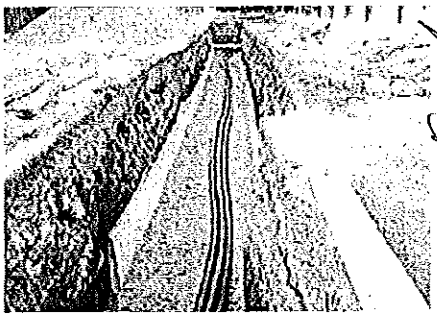
Our company offers:

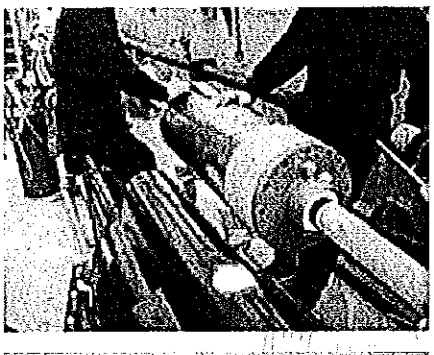
– medium and high voltage cable accessories;

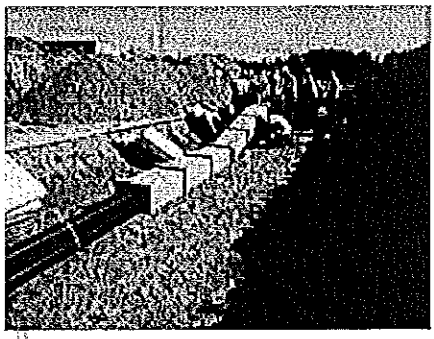
– technical support at all stages of cooperation.

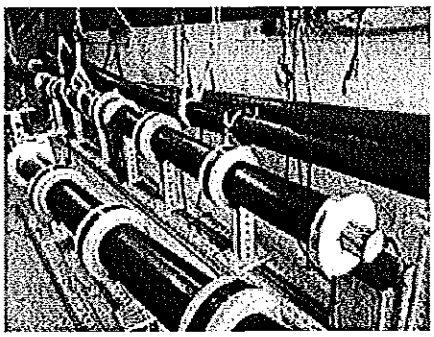


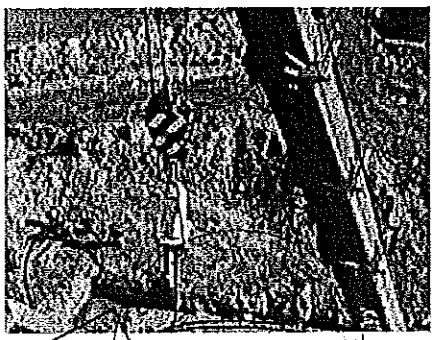












Markings

Conductor material	**Without designation**	Copper conductor
	A	Aluminum conductor
	RMS	Segmented conductor
Insulation material	Y	PVC insulation
	2XS	XLPE insulation
Screen	S	Copper wire and copper tape screen
	SE	Copper wire and copper tape screen around each cable conductor
	(F)	Watertight screen from swelling tape which provides longitudinal water sealing
	(FL)	Watertight screen from swelling tape which provides longitudinal water sealing and laminated polymer
Armouring	F	Wires armouring from galvanized steel
	G	Armouring: tape from galvanized steel winding with 2 spirals in the opposite directions
	B	Armouring from double steel tape
	R	Armouring from galvanized steel wire of coaxial shape
Sheath	K	Lead sheath
	Y	PVC sheath
	2Y	XLPE sheath
	H	Halogen free flame retardant sheath
	LWL (following screen designation)	Optic fibers in steel tubing inserted into copper

Comparative characteristics	6-35 kV XLPE-cables	Paper-insulated cables	
		10 kV	20-35 kV
Continuous permissible temperature, °C	90	70	65
Permissible heating in emergency, °C	130	90	65
Maximum permissible temperature under short-circuit current flow, °C	250	200	130
Minimum cable laying temperature without pre-heating, °C	-20	0	0
Relative permittivity ε at 20°C	2,4	4,0	4,0
Dielectric loss ratio tg δ at 20°C	0,001	0,008	0,008
Level differential at cable laying operation, m	not limited	15	15

Main advantages of XLPE-cables are:

- big cable transmission capability due to increased conductor permissible temperature (permissible load currents are 15-30% higher than those of paper-insulated cables, depending on cable laying conditions);
- high-current thermal stability at short circuit that is of a special importance when a cross-section has been chosen on the basis of short-circuit nominal current only;
- light-weight, smaller diameter and bending radius, which facilitates cable laying in both cable structures and underground along complicated routes;
- feasibility of cable laying at temperatures up to - 20°C without preheating due to the use of polymer materials in insulation and screening;
- low specific damageability (practice of XLPE-cables employment demonstrates that their damage resistance at least is 1-2 orders lower than that of paper-insulated and cables);
- absence of any liquid components (oils), and therefore, time and cost of cable laying and installation is reduced;
- single-core design permits cable to produce with a conductor with cross-section up to 1000 mm2 that is optimal for a large-power transmission;
- large lengths for construction: up to 2000-4000 m.

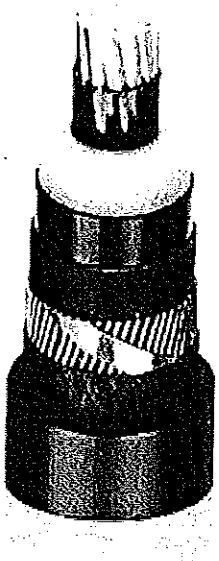
Take into account that the main type of single core cable faults are single-phase short circuit; it is possible to confirm that repair costs are drastically cut.

Strong insulation provides enormous advantages at the cable laying over a sloping, hilly or rough terrain, i.e. along the routes with considerable level difference, in vertical and inclined collectors.

286

Design

6, 10, 20 and 35 kV XLPE cable consists of a round copper or aluminum stranded conductor, a semiconductive layer over the conductor, a cross-linked polyethylene insulation, a conductive layer on the insulation, a conductive tape, a screen of cooper wires and a copper band, a separating layer, a high-density polyethylene sheathing, and a PVC plasticate sheathing or PVC plasticate sheath of reduced combustibility with reduced smoke and gas emission, or a sheath of halogen-free polyethylene composite.



In order to ensure the screen longitudinal sealing, a water-blocking conductive tape can be used in place of a conductive tape, and a water-blocking conductive tape layer can replace a separation layer.

Cables indexed «FL» are provided with an alumo-polymer tape sheath welded to the polyethylene or PVC sheath apart from having longitudinal sealing. Such a design creates an effective diffusion barrier stopping penetration of water vapors; and an outside sheath of black polyethylene provides protection against mechanical damage.

Field of application

2XS2Y, A2XS2Y, cables are used for underground lines for complicated sections of the routes, as well as for overhead lines providing proper fire protection. Cables with longitudinal sealing could be used for underground lines in humid soils and in damp, partially flooded premises.

2XSY, A2XSY, 2XS(FL)Y, and A2XS(FL)Y cables are used for cable structures and industrial premises (2XS(Fl)Y and A2XS(Fl)Y – in batch laying), and also underground in dry soils.

2XS(FL)Y-LS and A2XS(FL)Y-LS cables are intended for stationary overhead batch lines, in cable structures and premises that have specified limitation on smoke consistency in fire situations.

2XS(Fl)Y-HF and A2XS(Fl)Y-HF are used for stationary electrical installations inside public and industrial buildings limited by requirements restricting impact of corrosive gases.

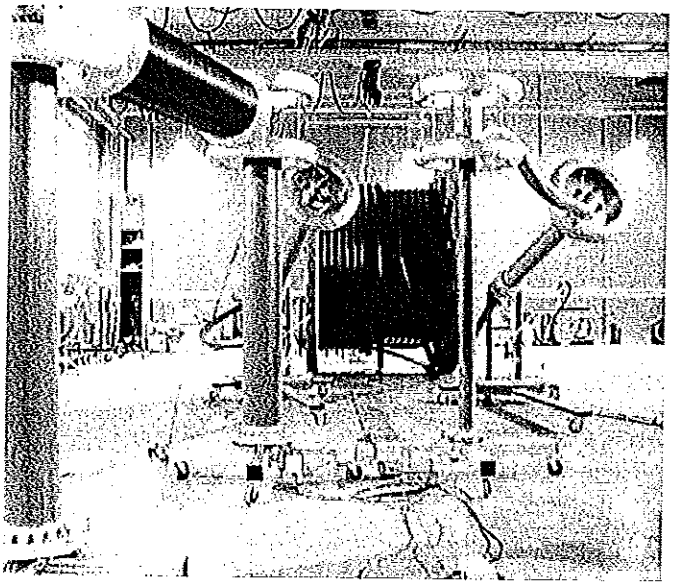
1 Cross-section of the screen shown in the Table is minimal. Cross-section of the screen is chosen under condition of short-circuit current.

2 Weight, outside diameter and continuous permissible cable currents are for cable types 2XS2Y и A2XS2Y with minimal cross-section of the screen. If a larger screen cross-section is desired, continuous permissible cable currents get lower because of increased losses in the screen.

3 Deviation from the nominal construction length is ± 1%.

290



Medium voltage cables load capacity is calculated for the following conditions:

Laid in ground:

load factor	1,0
depth of cable laying	0,7 m
soil thermal resistance	1,2 K•m/W
ambient temperature, t°	15°C
conductor temperature, t°	90°C

Laid in air

load factor	1,0
ambient temperature, t°	25°C
conductor temperature, t°	90°C

Continuous permissible currents are fixed for each cable line under service conditions with regard to specific requirements. At different design ambient temperatures, it is advised to use corrective ratios, given in the following Table.

When single-core cables are fixed in triangle formation they are laid immediately adjacent. When single core cables are laid in flat formation, clear distance between them is one cable diameter.

Correction factors for ambient temperatutre												
Temperatutre	-5	0	5	10	15	20	25	30	35	40	45	50
in ground	1,13	1,10	1,06	1,03	1,00	0,97	0,93	0,89	0,86	0,82	0,77	0,73
in air	1,21	1,18	1,14	1,11	1,07	1,04	1,00	0,96	0,92	0,88	0,83	0,78

Correction factors for specific soil resistance						
Soil specific thermal resistance, K·m/W	0.8	1,0	1.2	1.5	2.0	2.5
Correction factor	1,13	1,05	1,00	0,93	0,85	0,8

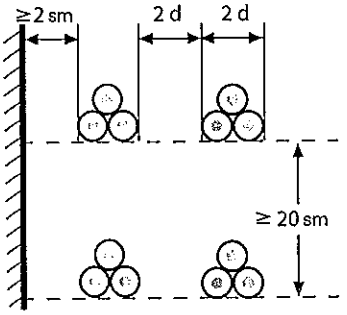
Correction factors for the laying depth						
Depth of cable laying, m	0,50	0,70	0,90	1,00	1,20	1,50
Correction factor	1,05	1,00	0,96	0,95	0,93	0,9

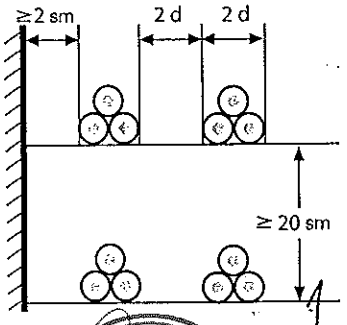
Correction factors on number of working cables arranged in plane side by side underground in pipes or without pipes, are used, when a section of a cable line between the earthing points is partially laid in pipes, under following conditions:

- cable are laid in a triangle formation over a substantial part of the line section;
- pipes are laid in flat formation;
- length of piping composes less than 10% of the section between the earthing points;
- each cable is laid in a separate pipe;
- pipe diameter is twice cable diameter.

Correction factors for side by side laying of the 6,10,15, 20 and 35 kV cables	
Cables partially laid in separate pipes	0,94
Cables in separate pipes on a plane	0,90
Single-conductor cables laid in triangle formation in a common pipe	0,90

Correction factors for group of cables in the ground					
Clear distance between groups, mm	Number of groups				
	2	3	4	5	6
100	0,76	0,67	0,59	0,55	0,51
200	0,81	0,71	0,65	0,61	0,49
400	0,85	0,77	0,72	0,69	0,66





Correction factors for group of cables in air arranged in a triangle			
Number of cables/systems on a rack			
Number of racks	1	2	3
1	1,00	0,98	0,96
2	1,00	0,95	0,93
3	1,00	0,94	0,92
4-6	1,00	0,93	0,90
1	0,95	0,90	0,88
2	0,90	0,85	0,83
3	0,88	0,83	0,81
4-6	0,86	0,81	0,79

Short-circuit currents

Short-circuit current for all types of cables and cross-sections are calculated on the basis of the following conditions:

Conductor temperature		Screen temperature	
before short-circuit	90°C	before short-circuit	70°C
after short-circuit	250°C	after short-circuit	350°C

Permissible conductor one-second short-circuit current														
Conductor cross-section mm²	50	70	95	120	150	185	240	300	400	500	630	800	1000	1200
Copper conductor	7,15	1,00	13,6	17,2	21,5	26,5	34,3	42,9	57,2	71,5	90,1	114,4	143,0	172,8
Aluminum conductor	4,7	6,6	8,9	11,3	14,2	17,5	22,7	28,2	37,6	47,0	59,2	75,2	93,9	114,3

Permissible screen one-second short-circuit current					
Screen [1] cross-section mm²	16	25	35	50	70
1-sec. screen short-circuit current , KA	3,3	5,1	7,1	10,2	14,2

If short-circuit duration differs from 1 sec., short-circuit values shown in the Tables are multiplied by correction coefficient:

$K = 1/\sqrt{t}$, where t — short-circuit duration, sec

[1] Values of permissible short-circuit currents for different cross-sections of the screen are calculated on request.

Electrical specification

Conductor's DC resistance at 20°C, Ω/km, not less

Conductor resistance at temperatures, different from 20°C, is calculated with the formula:

for copper conductor:
$R_\tau = R_{20} \cdot (234,5+\tau)/254,5$

for aluminum conductor:
$R_\tau = R_{20} \cdot (228+\tau)/254,5$

where:
τ — conductor's temperature, (°C),

R_{20} — conductor resistance at 20°C, (Ω/km),

R_τ — conductor resistance at d°C, (Ω/km)

Calculation of inductive reactances are carried out with cables arranged in a triangle immediately adjacent, and in flat formation with clear distance between the cables equal to cable diameter.

[1] Inductive values are calculated with regard to the screen earthing from both sides.

[2] Inductive reactance values for other classes of voltage and another arrangement of cables are calculated on request.

295

Cable laying conditions and testing after medium voltage cable laying accessories installation

Bending radius of XLPE cable during cable laying and accessories installation laying procedure shall be at least 15xD, where D — outside cable diameter. When cable accessories installation is carried out with the use of a special template minimal bending radius is permitted to be reduced down to template 7,5xD.

When installing with the use of a cable sleeve or taking by the conductor, pulling tension shall not exceed the following figures:

F=Sx50 N/ mm² — for copper conductor,
F=Sx30 N/ mm² — for aluminum conductor,
where S — conductor area of the cross-section, mm².

Cable temperature during installation shall be not lower than:

-15°C – for cables with PVC- plasticate sheath;
-20°C – for cables with polyethylene sheath.

This is achieved when keeping the cable in warm (about 20°C) premises during 48 hours or with the use of special equipment.

After cable laying and accessories installation it is recommended to conduct testing with the following AC voltage, frequency 0,1 Hz during 15 minutes:

10 kV cable with 18 kV,
15 kV cable with 45 kV,
20 kV cable with 60 kV,
35 kV cable with 105 kV voltage.

It is permissible to test with AC voltage of industrial frequency during 24 hours:

10 kV cable with 6 kV,
15 kV cable with 8,7 kV,
20 kV cable with 12 kV,
35 kV cable with 20 kV voltage.

On completing the installation and in coordination with cable manufacturing plant, cable testing is permitted with DC voltage of $4U_0$ during 15 minutes.

Cable sheath shall be tested with DC voltage of 10 kV, applied between the metallic screen and earthing device during at least 1 minute.

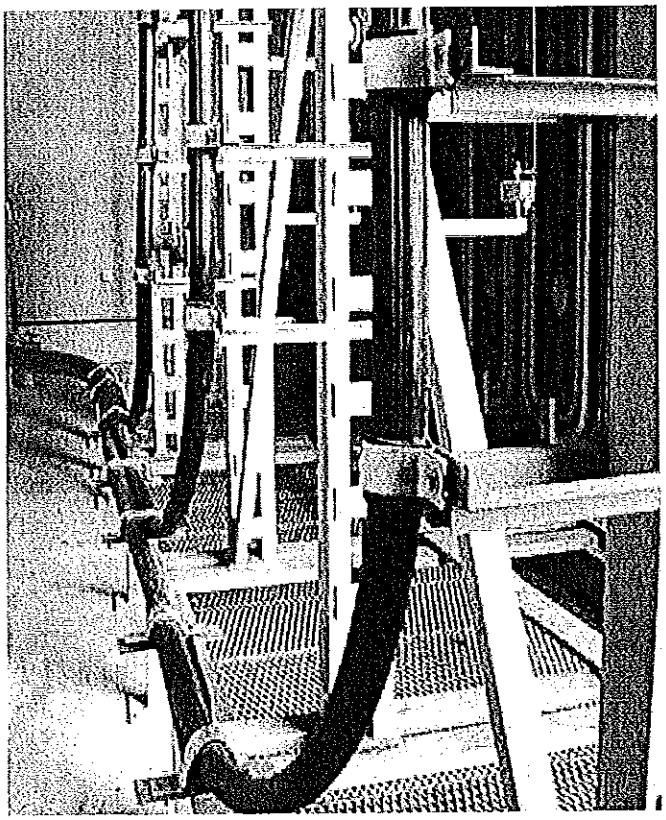
6, 10, 20 and 35 kV XLPE cable construction lengths are presented in the Table, they can be accommodated in standard wooden cable drums.

Construction lengths can be increased in coordination with customer using drums of greater capacity. In this way a special cable-carrying trucks; can be used in addition, one should be aware of oversized cargo transportation rules.

297

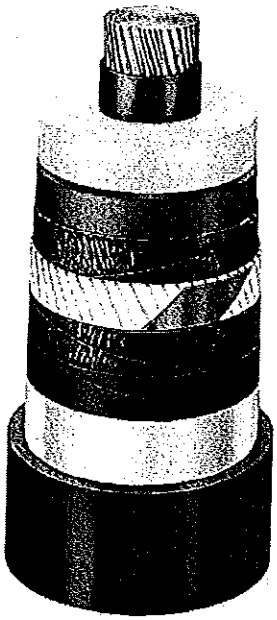
110-220 kV XLPE cables



Comparative characteristics	XLPE cable	High pressure oil-filled cable
Continuous permissible temperature, °C	90	85
Permissible heating in emergency, °C	105	90
Ultimate permissible temperature under short-circuit current flow, °C	250	200
Density of 1-sec. short-circuit current, A/mm² — copper conductor — aluminum conductor	 144 93	 101 67
Relative permittivity ε at 20°C	2,5	3,3
Dielectric loss ratio, tg δ at 20°C	0,001	0,004

Main advantages of XLPE cables are the following:

- high cable transmission capability due to increased conductor permissible temperature;
- high-current thermal stability at short-circuit that is of a special importance when a cross-section has been chosen on the basis of short-circuit nominal current only;
- light-weight, smaller diameter and bending radius, which facilitates laying in both cable structures and underground along complicated routes;
- strong insulation provides enormous advantages at the laying over a sloping, hilly or rough terrain, i.e. along the routes with considerable level difference due to absence of mass dulling effect;
- absence of liquids (oils) under pressure, and consequently, no need for costly refilling equipment, that results in considerable saving in operational costs, simplification of installation equipment, cutting time and cost of cable laying, as well as installation;
- feasibility of prompt repair in case of fault;
- absence of leakages and, therefore, no risks of environmental pollution in case of damage.



Design

110-220 kV XLPE cable consists of a round copper or aluminum stranded conductor, a semiconductive layer over the conductor, a cross-linked polyethylene insulation, a semiconductive layer on the insulation, a semiconductive tape, a screen of cooper wires and a copper band, a semiconductive tape, a polyethylene sheathing, or PVC plasticate sheathing.

The conductor is covered with an extrudable screen of semiconducting material, insulation and a semiconducting screen over the insulation binded together. Insulation thickness depends upon the conductor diameter.

Metallic screen consists of copper wires and a spirally applied over them a copper band. Screen cross-section is chosen on the basis of short-circuit current flow.

In order to provide longitudinal sealing in cables indexed «F», a layer of water-swellable material is used. Contacting with water it swells thus forming a longitudinal barrier, preventing in this way moisture propagation, should damage of outside sheathing occur.

Cables indexed «FL» are provided with an alumo-polymer tape sheath welded to the polyethylene or PVC sheath apart from having longitudinal sealing. Such a design creates an effective diffusion barrier stopping ingress of water vapors; and an outside sheath of black polyethylene provides protection against mechanical damage.

Reinforced polyethylene stiffened sheath.

Cables have a sheath of black polyethylene. Cables indexed «2Y» are provided with reinforced polyethylene longitudinally stiffened sheath that is designed for preventing the sheath damage while cabling at complicated sections of cable routes.

On request of customer 110-220 kV cables can be produced with optic fiber inserted for temperature measurements along the entire length of the cable and for transmitting any signals.

301

Load capacity

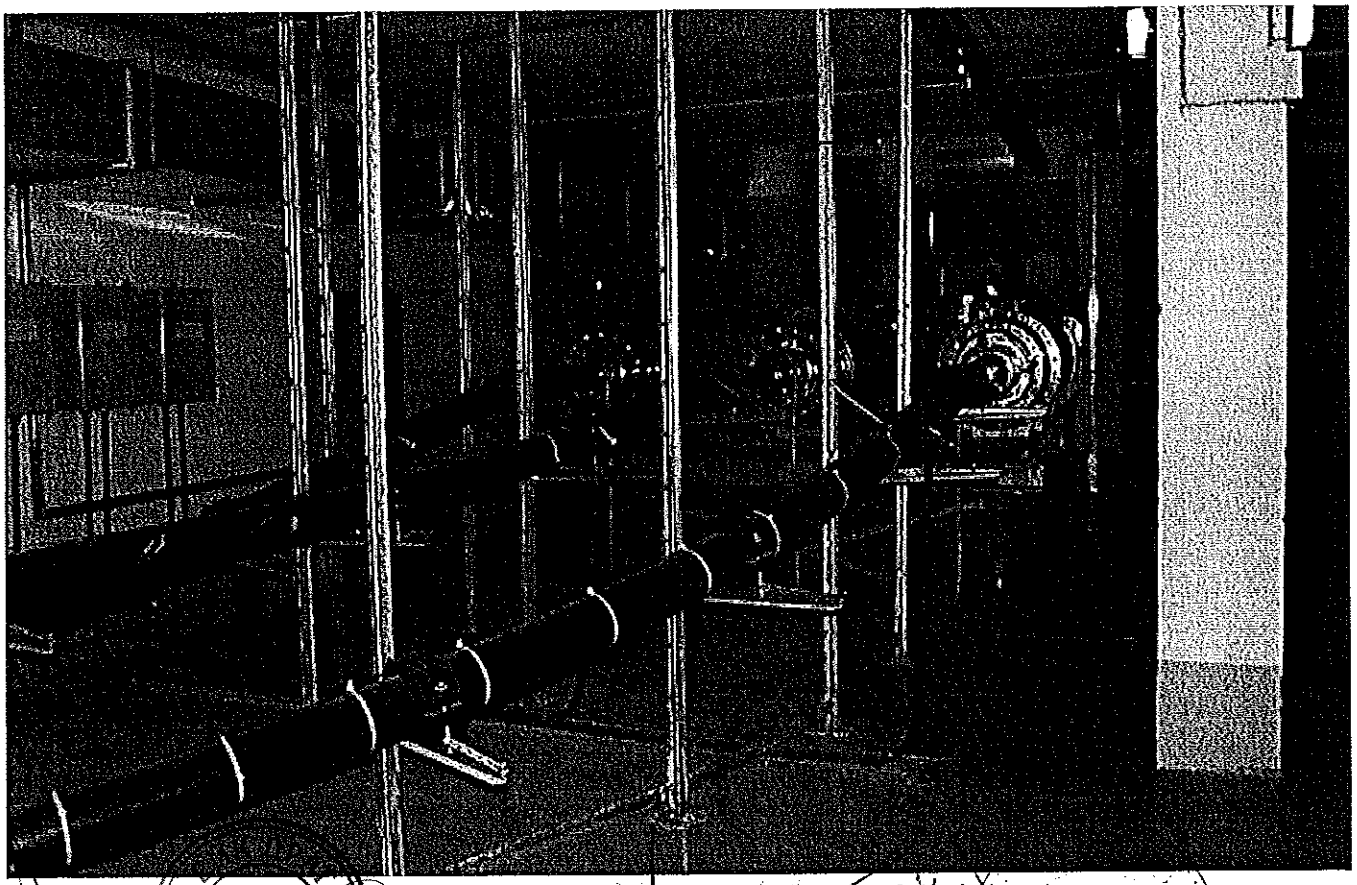
Load capacity of high voltage cables is calculated under the following conditions.

Laid in ground:		**Laid in air:**	
load factor	0,8	load factor	1,0
depth of cable laying	1,5 m	ambient temperature, t°	25°C
soil thermal resistance	1,2 K•m/W	conductor temperature, t°	90°C
ambient temperature, t°	15°C	screen earthing	from both sides
conductor temperature, t°	90°C		

For underground installation and with triangle arrangement, cables shall be positioned in immediate adjacency. For overhead lines and triangle arrangement of cables the clear distance between cables is recommended be equal to 25 sm. With flat arrangement of cables, recommended clear distance between cables shall be cable diameter.

Correction factor on laying depth

Laying depth, m	0,8	1,0	1,2	1,4	1,6	1,8	2,0	2,2	2,4
Correction factor	1,08	1,05	1,03	1,01	1,0	0,98	0,97	0,96	0,94



Short-circuit currents

Short-circuit current for all types of cables are calculated on the basis of the following preconditions:

Conductor temperature	
before short-circuit	90°C
after short-circuit	250°C

Screen temperature	
before short-circuit	70°C
after short-circuit	350°C

XLPE cable can be subjected to overloads with temperatures above 90°C. In this regard, emergency overloads do not considerably affect cable service life.

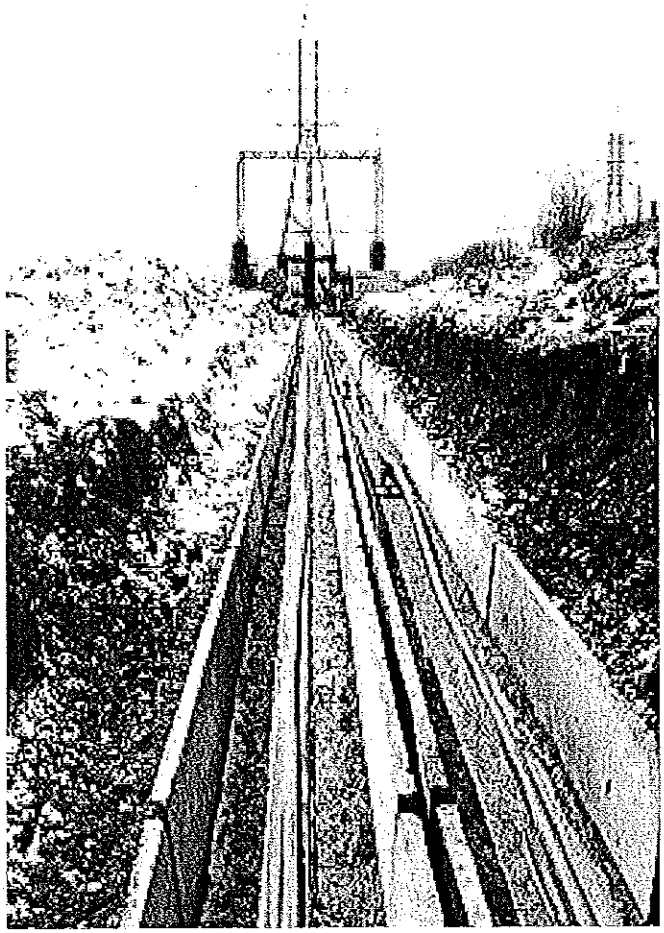
One-second long permissible short-circuit currents along the conductor and through the screen shall not exceed the figures presented in the Tables.

1 sec. permissible short-circuit current in the conductor												
Conductor cross-section, mm²	185	240	300	350	400	500	630	800	1000	1200	1600	2000
copper conductor	26,5	34,3	42,9	50,1	57,2	71,5	90,1	114,4	14	172,8	230	288
aluminum conductor	17,5	22,7	28,2	33,1	37,6	47	59,2	75,2	93, 1	14,3	152	190

1 sec. permissible short-circuit current the screen										
Screen cross-section, mm²	35	50	70	95	120	150	185	210	240	265
Screen 1-sec. short-circuit current, KA	7,1	10,15	14,21	19,29	24,36	30,45	37,56	42,63	48,72	53,8

In the case of short-circuit, apart from the heating, the dynamic forces originated between cable phases shall be also taken into consideration; their values can be significant. They shall be taken into account while choosing design of cable fixing means.

Cable laying conditions and testing after high voltage cable laying



During XLPE 110-220 kV cable laying the bending radius shall be at least 15xD, where D — outside cable diameter. When cables accessories installation is carried out with the use of a special template and with preheating, minimal bending radius shall also be at least 15xD.

When installing with the use of a cable sleeve or taking by the conductor, pulling force shall not exceed the following figures

F=Sx50 N/ mm^2 — for copper conductor,
F=Sx30 N/ mm^2 — for aluminum conductor

where S — conductor area of the cross section, mm^2.

Ambient temperature during laying shall not be lower than -5°C. With preheating, cable laying can be carried out at the following temperatures:

-15°C – for cables with PVC-plasticate sheath;
-20°C – for cables with polyethylene sheath.

Following cable installation, testing of completed cable line together with all the cable accessories shall be conducted.

Having completed a cable line and prior to its commissioning, each phase of the cable and its accessories shall be tested by increased AC voltage of 128 kV during one hour with frequency of 20 to 300 Hz. As agreed between manufacturing company and customer, it is permitted to conduct testing by nominal working AC voltage of 64 kV during 24 hours at no load, instead of the test by increased AC voltage. The test by increased DC is feasible, but not recommended, and only as agreed between manufacturing company and customer.

Cable sheath shall be tested by DC of 10 kV, applied between a metallic screen and earthing for one minute.

During Estralin HVC cable laying the requirements of "Maintenance of XLPE cable laying 110-500 kV, №ТИ/01-12" should be met.

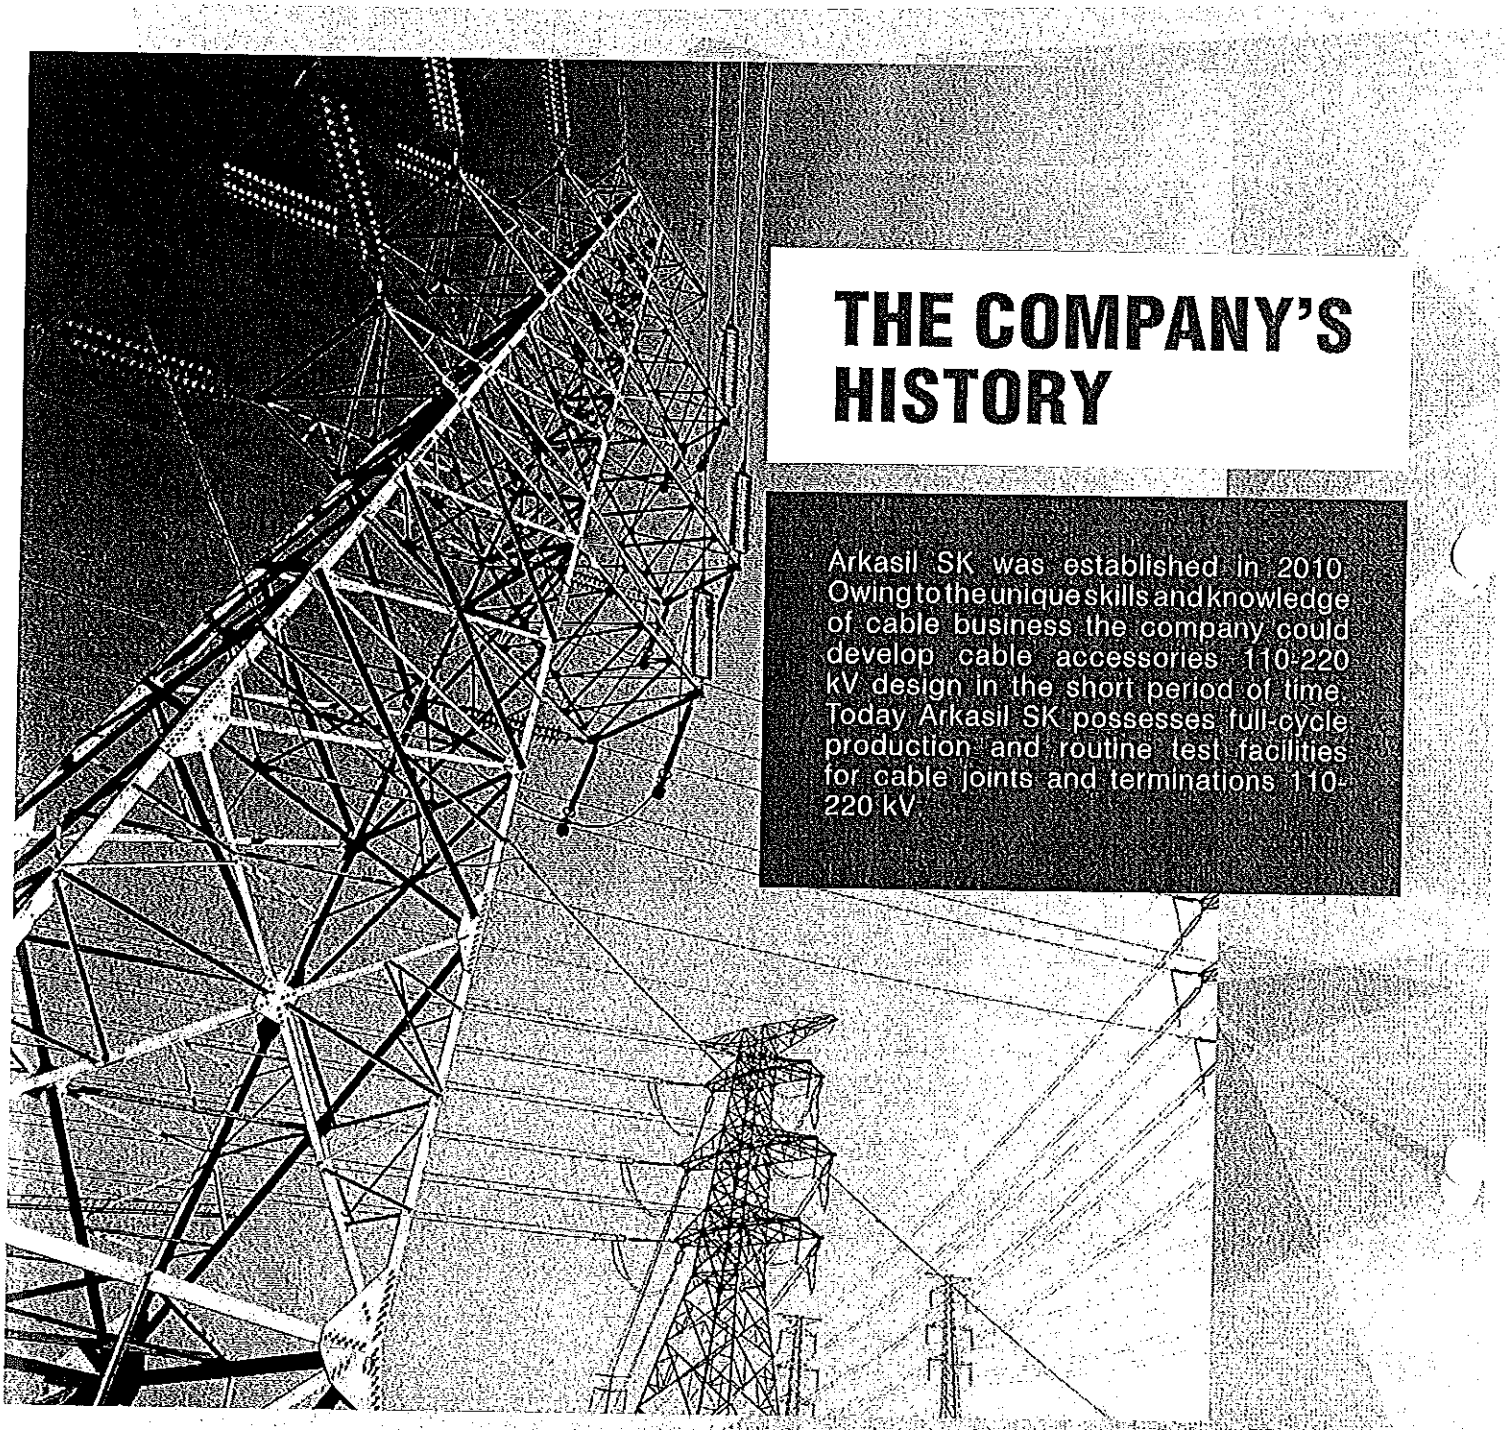
CABLE ACCESSORIES

110-220 kV

www.arkasil.com

Arkasil



THE COMPANY'S HISTORY

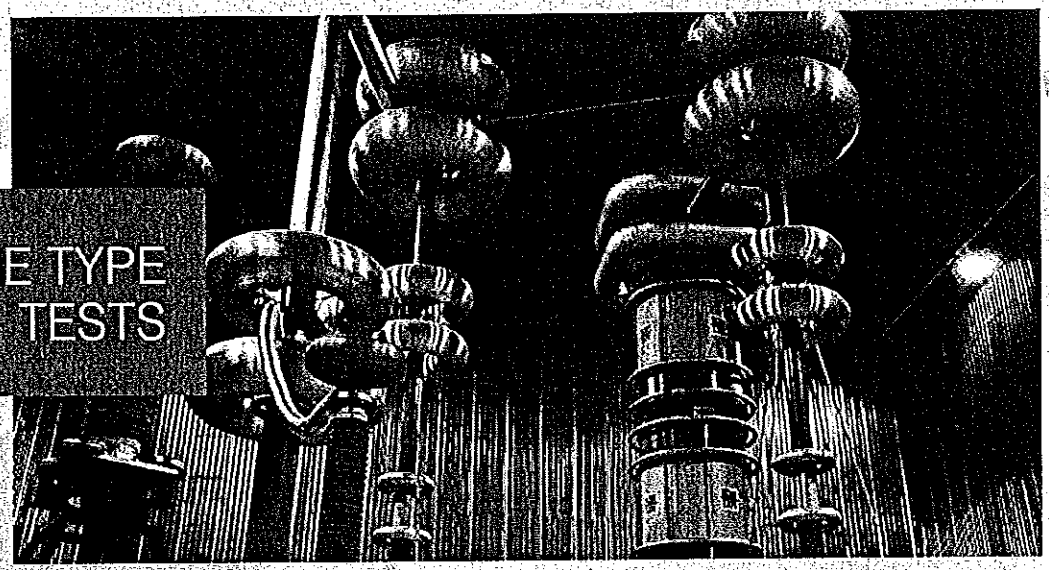
Arkasil SK was established in 2010. Owing to the unique skills and knowledge of cable business the company could develop cable accessories 110-220 kV design in the short period of time. Today Arkasil SK possesses full-cycle production and routine test facilities for cable joints and terminations 110-220 kV.

THE MAIN INFORMATION

Long terms of cable accessories delivery very often could be a big problem for cable lines establishing. That is why there is a great demand of cable accessories for HV cables in the market, with high quality and minimum terms of delivery for the reasonable price. Arkasil SK sets the goal to hold a strong position in the cable business.

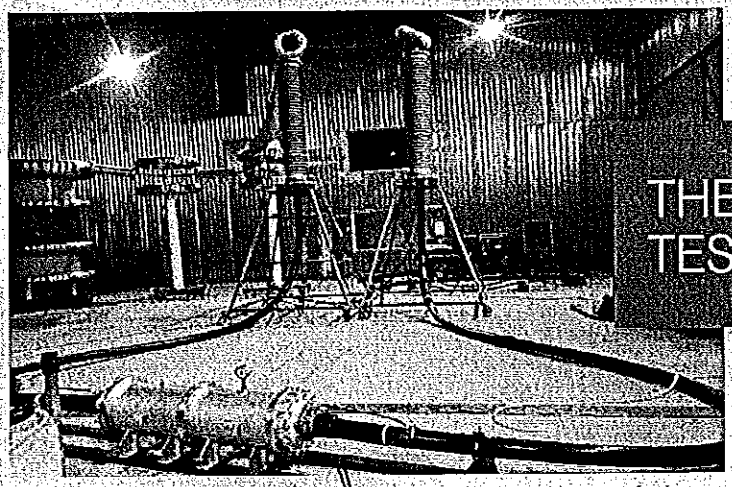
The main activity of Arkasil is HV accessories 110-220 kV production and delivery, and also related products such as tools, heat-shrinkable components and other products for cable line construction.

Arkasil



THE TYPE TESTS

At the beginning of 2011 the type tests of the cable accessories 110 (126) kV were successfully carried out together with CESI (the leader among the tests and certificates). Another type tests of cable accessories of Arkasil SK were carried out in 2011. Tests were made according to the program of the harmonized European standard HD 632 S2, part 1, analogue of IEC 60840 edition 3 (2004), in the test laboratory of KEMA (Netherlands). Also the company has KEMA type tests report for 132 (145) kV in 2013. In 2013 type tests of the cable accessories 220 (252) kV of Arkasil production were successfully passed under CESI supervision. In 2014 the company started type tests of GIS termination 220 (252) kV.



THE LONG-TERM TESTS

In 2013 the company started long-term tests of the cable system 220 kV, including a cable 2500 mm² and cable accessories 220 kV of Arkasil.

ISO 9001: 2008

Arkasil SK LLC applies a management system in line with ISO 9001 : 2008 standard for XLPE cable accessories 110-220 kV, design, production, training, installation and supervision.

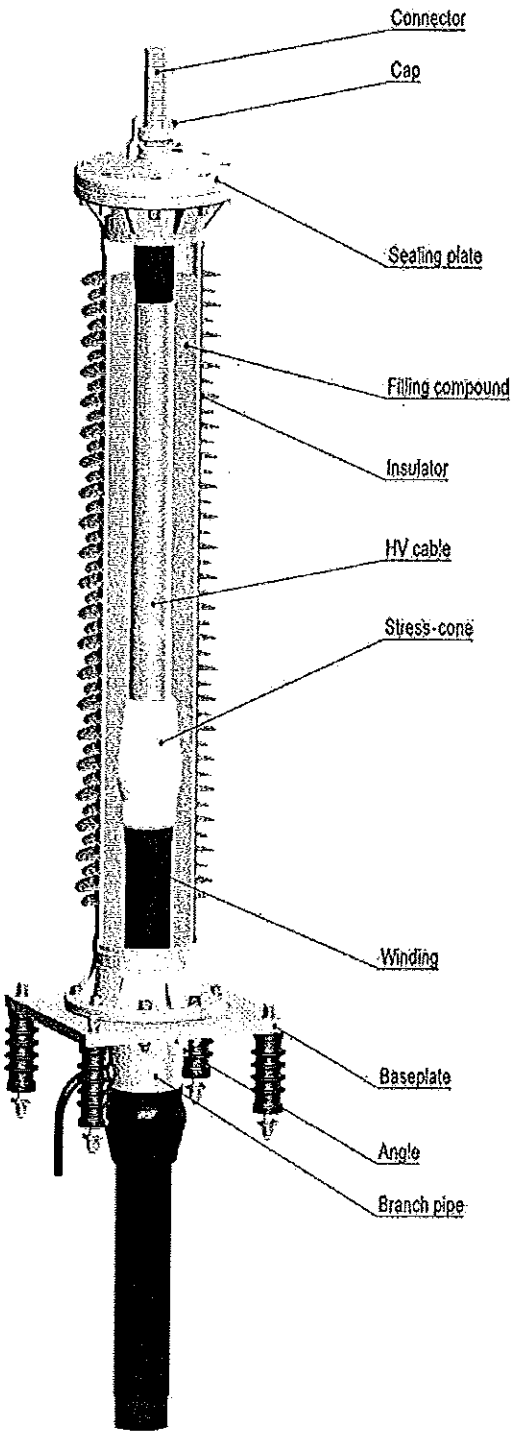
ARKASIL

LIST OF CONTENT

110 kV (126 kV)
Terminations MKB 126



Arkasil termination with composite type insulator is used for cable line connection to other elements of power-supply systems. Termination MKB 126 is used for outdoor and indoor installation, for XLPE cables 64/110 kV with the conductor cross-section up to 2000 mm².

Basic components

Insulator:

- composite type insulator with glass fiber reinforced epoxy resin tube and silicone rubber sheds;
- sheds color–light gray;
- top and bottom flanges glued and sealed to the composite insulator.

Cable end:

- pre-moulded and factory-tested silicone stress cone;
- cable end;
- base plate;
- branch pipe with flange;
- support insulators;
- seals and fixing materials;
- unpressurised synthetic oil as an insulating compound;
- optic fiber outlet.

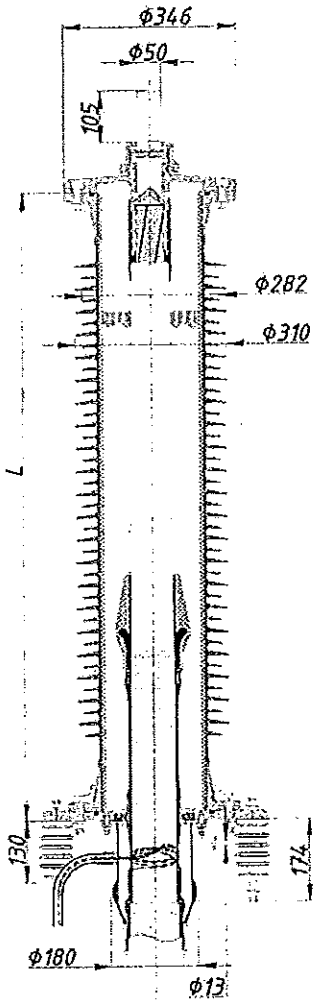
Area of application

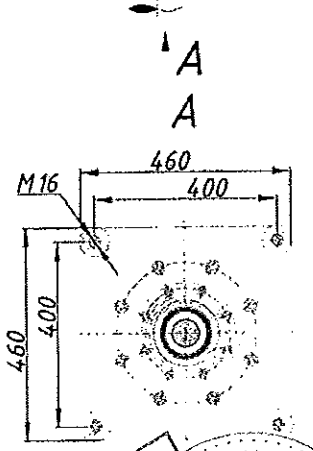
Type		MKB 126
Phase voltage	kV	64
Line voltage	kV	110
Maximum system voltage	kV	126
Cable conductor cross section range	mm²	185 ÷ 2000
Maximum cable sheath diameter	mm	115
Maximum cable insulation diameter	mm	91

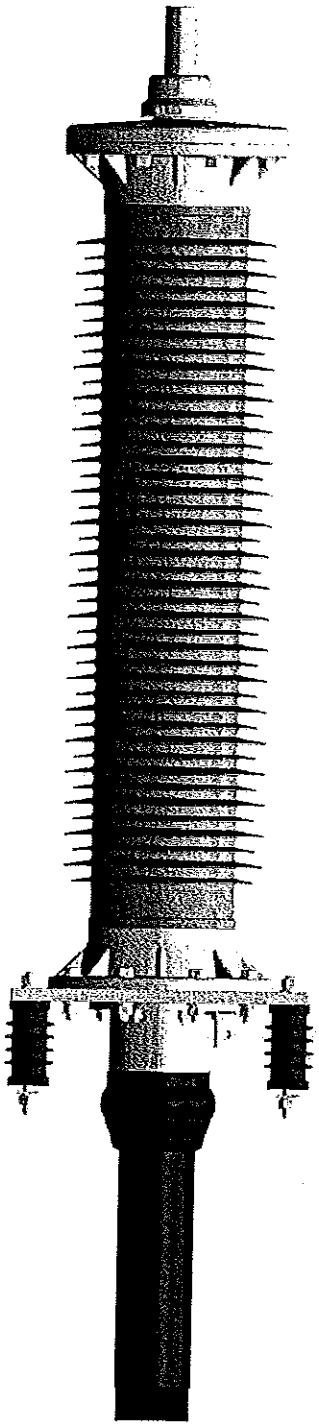
Installation options:

On support	+
On high-voltage power transmission line	+
On support at an angle	+

Installation can be simplified by assembling the termination horizontally on the ground before lifting it into place.







Technical data

Electrical parameters:	
AC voltage withstand test	160 kV for 30 min
Partial discharges	<5 pC at 96 kV
Impulse voltage (10+/10- impulses)	550 kV

Climatic characteristics:	
Temperature	-50°C / +45°C

Nominal operating current:
limited by cable specification

Stress-cone routine tests for MKB 126:	
AC voltage withstand test	160 kV for 30 min
Partial discharges	<5pC at 96 kV

Support insulator withstand voltage:	
AC voltage	10 kV
DC voltage	20 kV

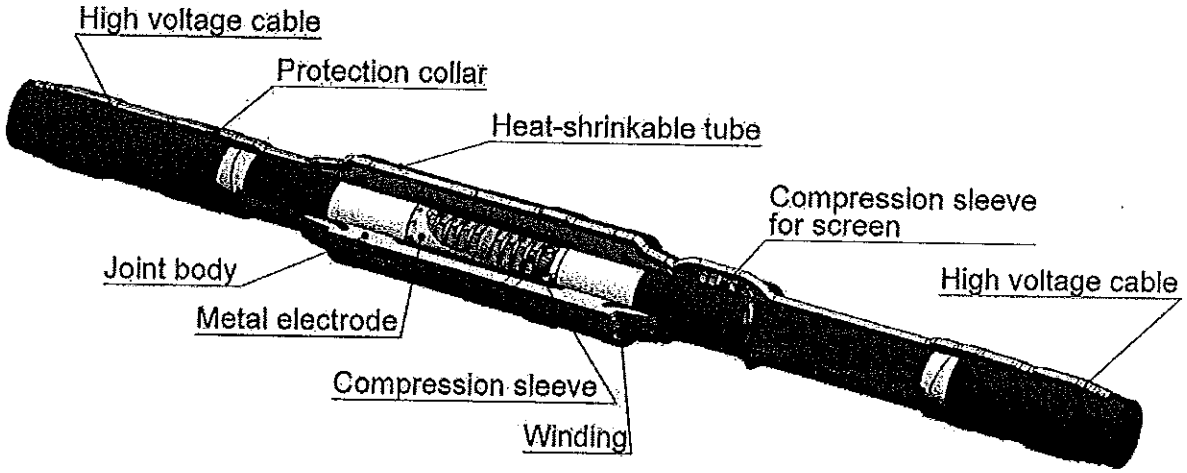
110 kV (126 kV)
Joints MCB 126

Arkasil joint is designed to connect two extruded high-voltage cables XLPE 64/110 kV. Joint MCB 126 could be produced in different designs: with screen wires direct connection, cross-bonding connection of different cable phase wires screen (screen cross-bonding), wires screen connection with optical fibers in the metal tubes.

Main components:

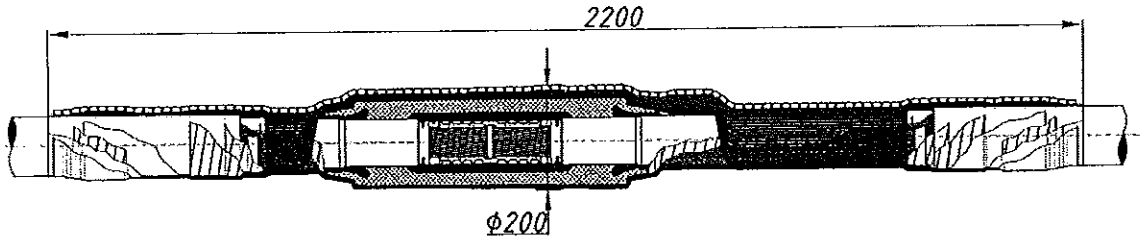
- pressed or screwed connection sleeves for cooper or aluminum conductors;
- insulator (silicone pre-molded joint body with elements for electrical field stress control);
- special tapes for different purposes;
- protective covering by shrinkable tubes and sleeves;
- cooper case protection;
- coffin box protection.



Area of application

Type		MCB 126
Phase voltage	kV	64
Line voltage	kV	110
Maximum system voltage	kV	126
Cable conductor cross section range	mm²	185 ÷ 2000
Maximum cable sheath diameter	mm	115
Maximum cable insulation diameter	mm	91
Nominal minimum insulation thickness	mm	10,5

Installation	
In the ground	+
On the air	+
Outdoor and indoor	+



Technical data

Electrical parameters:	
AC voltage withstand test	160 kV for 30 min
Partial discharges	<5 pC at 96 kV
Impulse voltage (10+/10- impulses)	550 kV

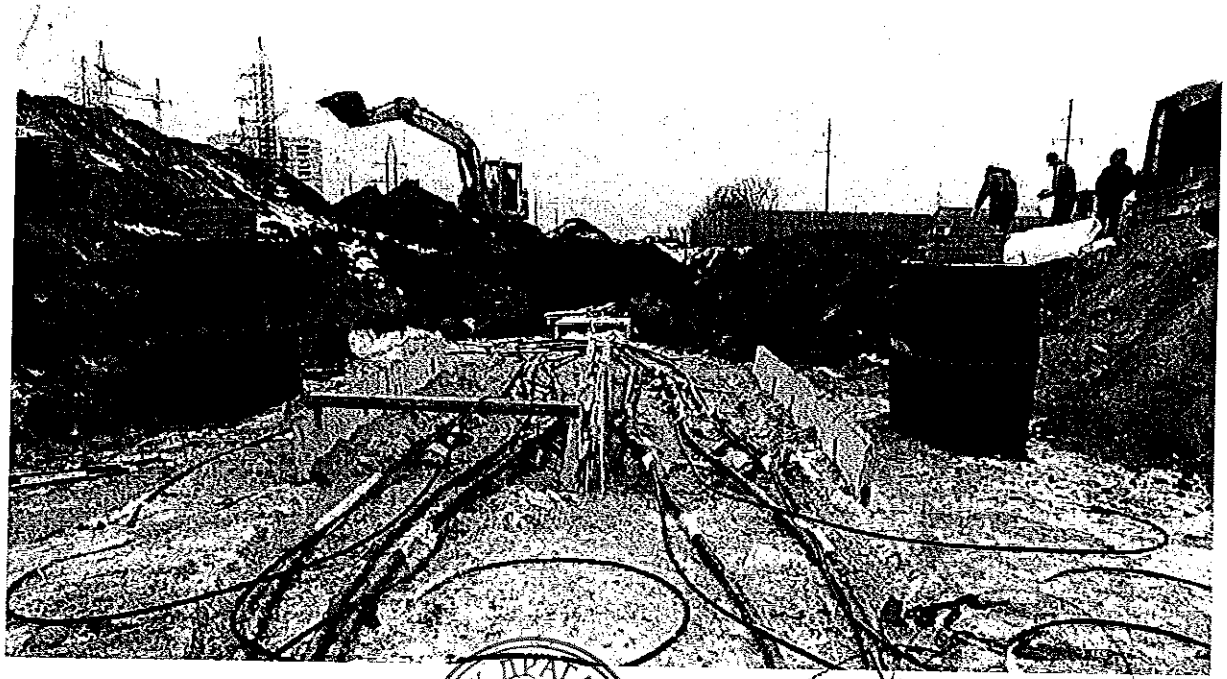
Current load rating:	
Rated operational current:	limited by cable specification
Short circuit current:	limited by cable specification

Climatic characteristics:	
Temperature	-50°C / +45°C

Stress-cone routine tests:	
AC voltage withstand test	160 kV for 30 min
Partial discharges	<5pC at 96 kV

Cable sheath test voltage:	
AC voltage	10 kV within 1 min
DC voltage	20 kV within 1 min

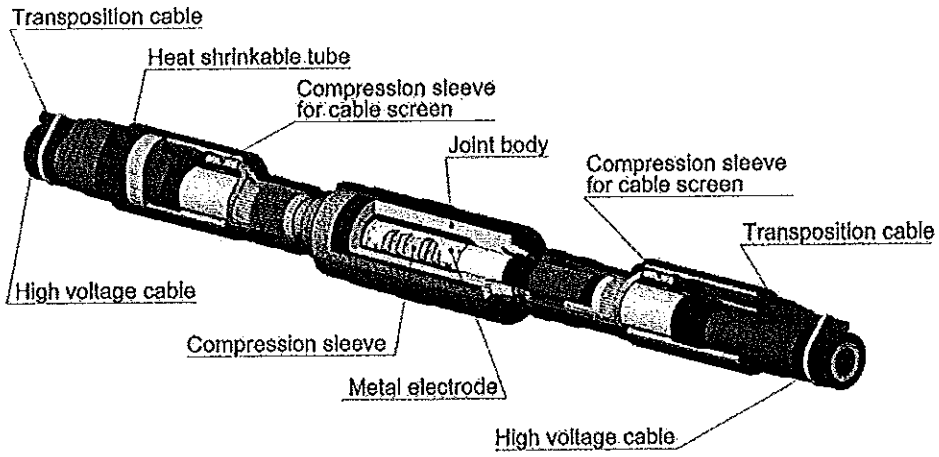
Mechanical characteristics:	
Approximate weight, kg	35

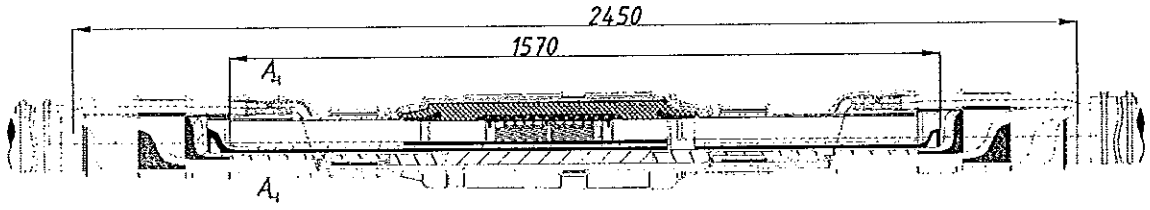


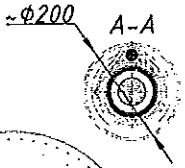
110 kV (126 kV)

Cross-bonding joints MCB 126 X

The cross-bonding joint MCB 126 X is designed to connect two extruded high-voltage cables XLPE 64/110 kV with cross connection of wire screens. Screen outlet from both sides is provided by cross-bonding cable. There is the dielectric insertion in the joint for screen interruption.





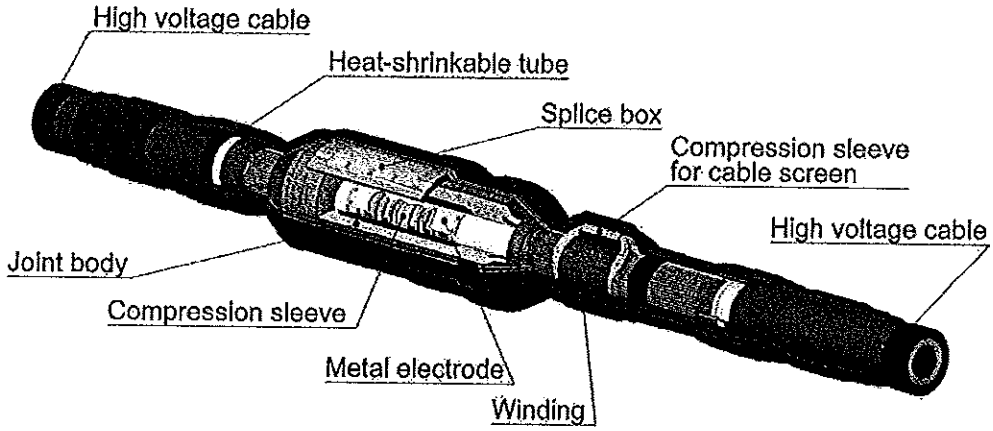


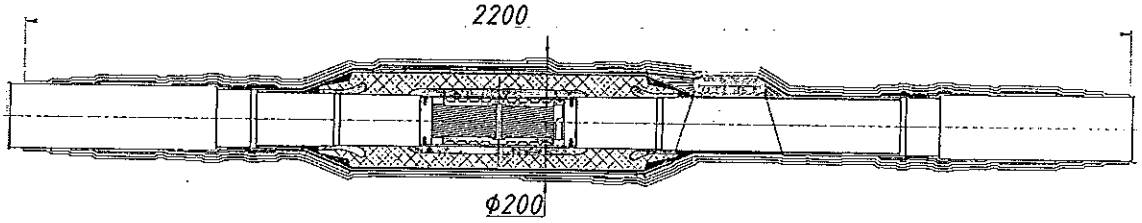
110 kV (126 kV)

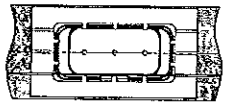
Joints with optic fiber connection MCB 126 O

The joint with opric fiber connection MCB 126 O is designed to connect two extruded high-voltage cables XLPE 64/110 kV with connection of wire screens including optical module.

The design of joint includes splice box for connection of fiber-optical modules embended in the high-voltage cables screens.







110 kV (126 kV)
Transition joints MCB 126 T

The transition joint MCB 126 T is designed to connect two extruded high-voltage cables XLPE 64/110 kV. Transition joints MCB 126 T are designed to connect cables with different conductors cross-sections including solid conductors connection and different insulation thickness.

132 kV (145 kV)
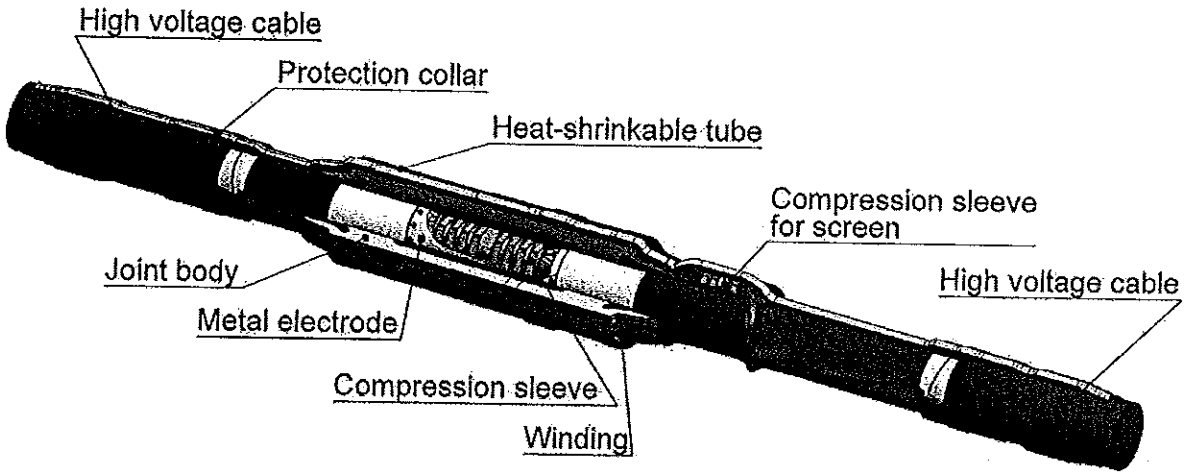
Joints MCB 145

Arkasil joint is designed to connect two extruded high-voltage cables XLPE 76/132 kV. Joint MCB 145 could be produced in different designs: with screen wires direct connection, cross-bonding connection of different cable phase wires screen (screen cross-bonding), wires screen connection with optical fibers in the metal tubes.

Main components:

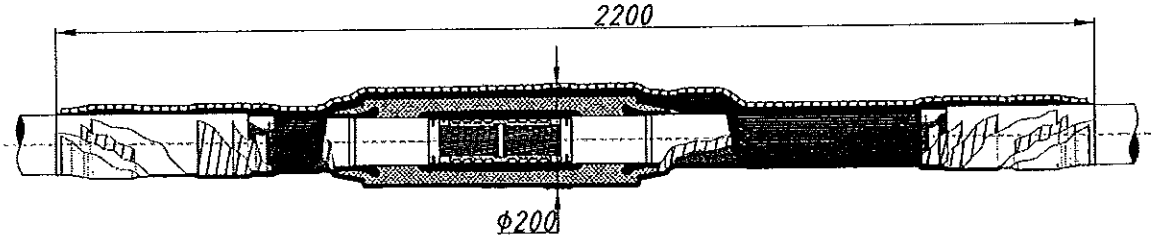
- pressed or screwed connection sleeves for cooper or aluminum conductor;
- insulator (silicone pre-molded joint body with elements for electrical field stress control);
- special tapes for different purposes;
- protective covering by shrinkable tubes and sleeves;
- cooper case protection;
- coffin box protection.



Area of application

Type		MCB 145
Phase voltage	kV	76
Line voltage	kV	132
Maximum system voltage	kV	145
Cable conductor cross section range	mm²	185÷2000
Maximum cable sheath diameter	mm	115
Maximum cable insulation diameter	mm	91
Nominal minimum insulation thickness	mm	14

Installation:	
In the ground	+
On the air	+
Outdoor and indoor	+



Technical data

Electrical parameters:

AC voltage withstand test	190 kV for 30 min
Partial discharges	<5 pC at 114 kV
Impulse voltage (10+/10- impulses)	650 kV

Current load rating:

Rated operational current	limited by cable specification
Short circuit current	limited by cable specification

Climatic characteristics:

Temperature	-50°C / +45°C

Stress cone routine tests:

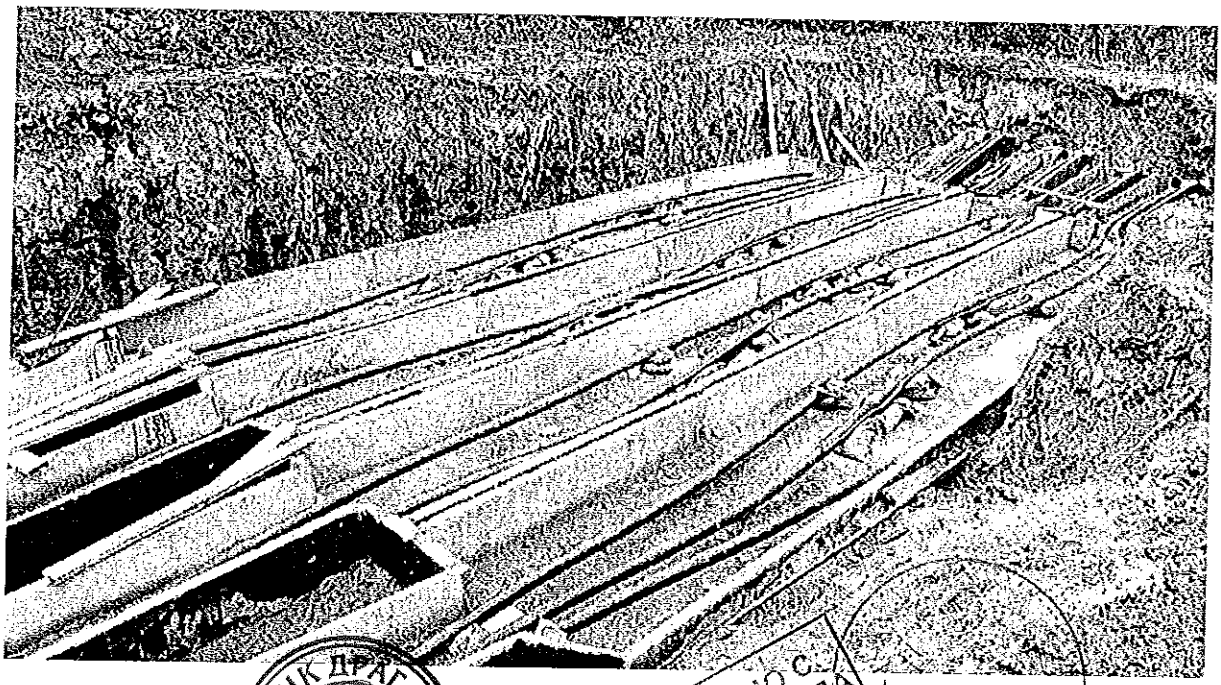
AC voltage withstand test	190 kV for 30 min
Partial discharges	<5pC at 114 kV

Cable sheath test voltage:

AC voltage	10 kV within 1 min
DC voltage	20 kV within 1 min

Mechanical characteristics:

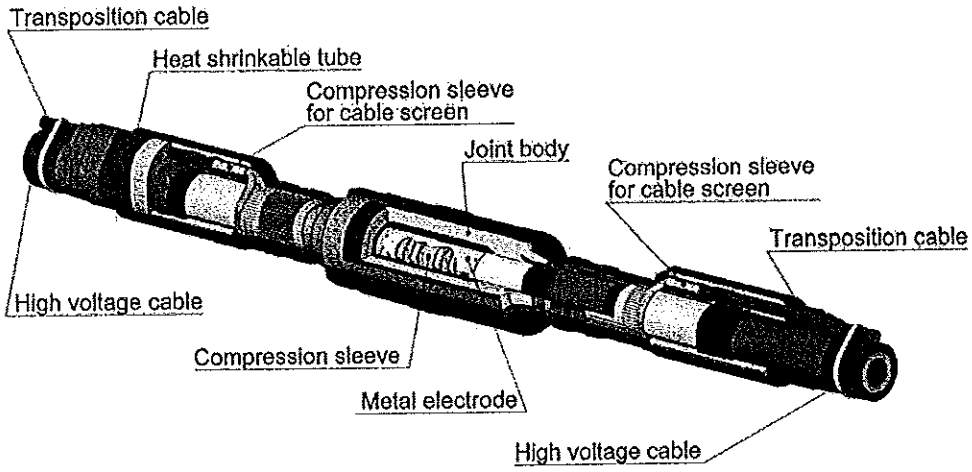
Approximate weight, kg	35

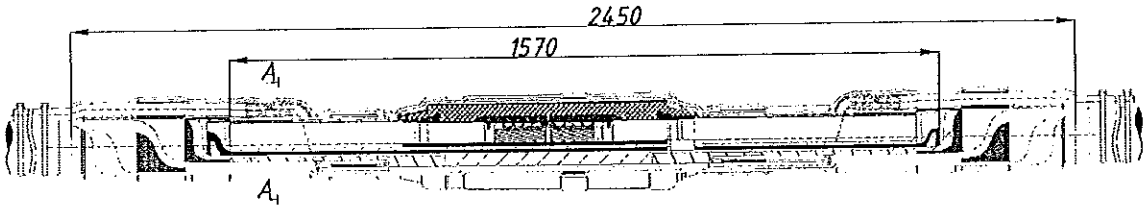


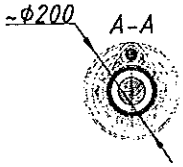
132 kV (145 kV)

Cross-bonding joints MCB 145 X

The cross-bonding joint MCB 145 X is designed to connect two extruded high-voltage cables XLPE 76/132 kV with cross-connection of wire screens. Screen outlet from both sides is provided by cross-bonding cable. There is the dielectric insertion in the joint for screen interruption.







132 kV (145 kV)

Joints with optic fiber connection MCB 145 O

The joint with opric fiber connection MCB 145 O is designed to connect two extruded high-voltage cables XLPE 76/132 kV with connection of wire screens including optical module.

The design of joint includes splice box for connection of fiber-optical modules embended in the high-voltage cables screens. .

INSPECTED BY KEMA Nederland B.V., Arnhem, The Netherlands

TEST LOCATION OMACS LLC, Moscow, Russia

DATE(S) OF TESTS 4 July to 20 September 2013

TEST SPECIFICATION The tests have been carried out based on IEC 60840 (2011), Clause 13.4

SUMMARY AND CONCLUSION The outdoor termination and the cross bonding joint passed the tests.

This report applies only to the object tested. The responsibility for conformity of any object having the same type designation as the tested object rests with the manufacturer.

This report consists of 45 pages in total.

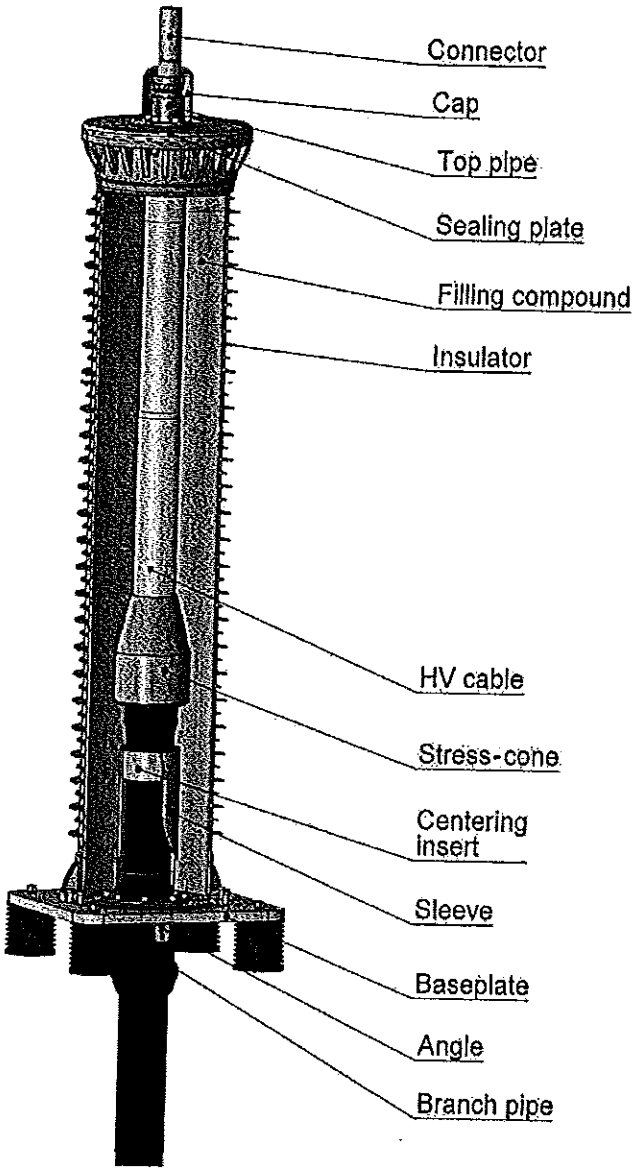
220 kV (252 kV)
Terminations MKB 252



Arkasil termination with composite type insulator is used for cable line joints with other elements of power-supply systems. Termination MKB 252 is used for outdoor and indoor installation, for XLPE cables 127/220 kV with the conductor cross section up to 2500 mm².

Basic components

Insulator:

- composite type insulator with glass fiber reinforced epoxy resin tube and silicone rubber sheds;
- sheds color--light gray;
- top and bottom flanges glued and sealed to the composite insulator.

Cable end:

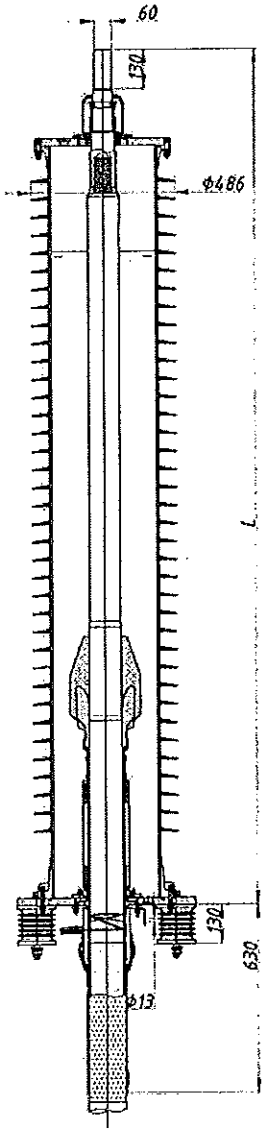
- pre-moulded and factory-tested silicon stress-cone;
- cable end;
- base plate;
- branch pipe with flange;
- support insulators;
- seals and fixing materials;
- unpressurised synthetic oil as an insulating compound;
- optic fiber outlet.

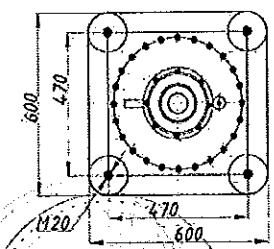
Area of application

Type		MKB 252
Phase voltage	kV	127
Line voltage	kV	220
Maximum system voltage	kV	252
Cable conductor cross section range	mm²	400÷2500
Maximum cable sheath diameter	mm	150
Maximum cable insulation diameter	mm	108

Installation	
On support	+
On high-voltage power transmission line	+
On support at an angle	+

Installation can be simplified by assembling the termination horizontally on the ground before lifting it into place.





Technical data

Electrical parameters:	
AC voltage withstand test	318 kV for 30 min
Partial discharges	<5 pC at 190 kV
Impulse voltage (10+/10- impulses)	1050 kV

220 kV (252 kV)
GIS terminations MBB 252

Arkasil GIS terminations are designed to connect cable lines to the gas insulated switchgear. Also, they are named GIS plug-ins, GIS adaptors. GIS terminations conform to IEC 62271-209. GIS termination consists of epoxy insulator and plug-in part. Due to such design, a cable can be disconnected from the GIS and be connected again. The epoxy insulator can be delivered with GIS or with plug-in part.

HEAT-SHRINKABLE COMPONENTS

Heat shrinkable cable end caps

Heat Shrinkable cable End Caps are used to seal the ends of all types of Cables protect from ingress of water/moisture. The caps are manufactured from high quality cross linked polyolefin material.

Compatible with most commonly used Cable Jackets i.e. XLPE, PVC, PILC or Rubber Sheathed Cable.

Hot Melt adhesive lining provides seal on irregular cable sheaths.

Excellent resistance to weathering, moisture, contamination and adverse environmental conditions.

Area of application:

- valved end caps available for pressurized application for Telecom cables;
- special Relief valved End Caps available for degassing application in High Voltage Power cables;
- high voltage (non tracking) End Caps available for sealing live parts;
- conductive End Caps are available with conductive mastic.

HEAT-SHRINKABLE COMPONENTS

Heat shrinkable tubes

Heat Shrinkable Tubes ASMW and ASHW are medium wall and heavy wall black tubes. ASMW tubes are used for environmental protection of cable termination and insulating the connectors for straight through joints/splice. ASHW tubes are used for mechanical protection and outer sealing of underground straight through cable joints / splice.

Technical specification

- these tubes are manufactured from high quality cross inked polyolefin material;
- optional hot melt adhesive lining for complete environmental protection and insulation;
- excellent resistance to weathering, UV rays, chemical and solvents;
- maximum cut length available up to 1500 mm;
- custom dimensions, thickness, length & colours available on request;
- conforms to IEC standard.

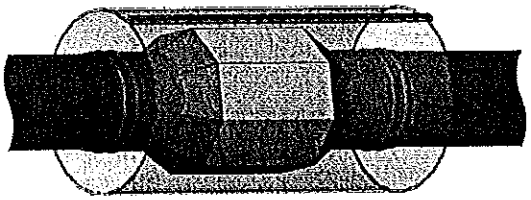
HEAT-SHRINKABLE COMPONENTS

Heat shrinkable wrap around sleeve

For the protection of Cable joint

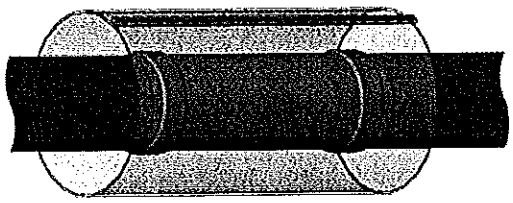


Heat Shrinkable Wrap Around Sleeve is a cross linked polyolefin tube which is folded around the cable/pipe, zipped up with a stainless steel channel and then heat shrunk.It is also called as (Cable Repair Sleeve).

Shut down of system not required for repair

- hot melt adhesive provides complete environmental sealing and insulation;
- high resistance to UV rays, chemicals, corrosion, fungus, etc.;
- temperature sensitive paint changes colour when heat shrinking process is complete;
- maximum length available up to 1500 mm.

For Cable Repairs



For corrosion protection of Oil, Water & Gas pipeline

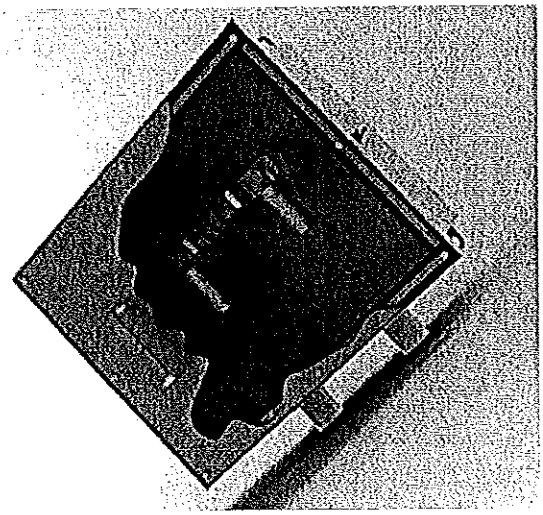
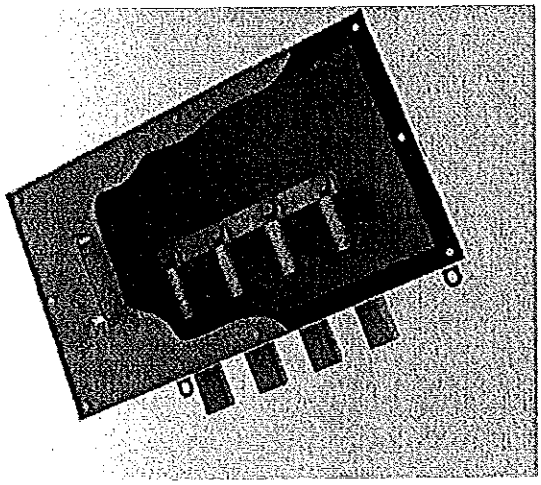
EARTHING AND CROSS-BONDING BOXES





Earthing boxes

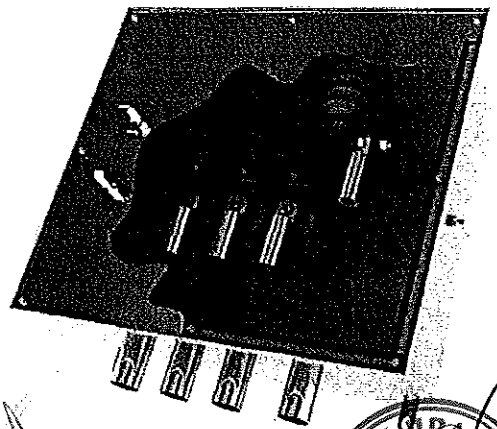
Earthing boxes are designed for earthing of cable screens when setting up 110 to 500 kV line.

Main components:

- stainless steel box with a sealed hood;
- sealed cable inputs;
- device housing earthing;
- surge arrester (standard, network, voltage 6 kV);
- insulators (standard, voltage rating 10 kV);
- copper buses for connection of insulators (for opening the circuit);
- sealed cable terminals to be crimped.

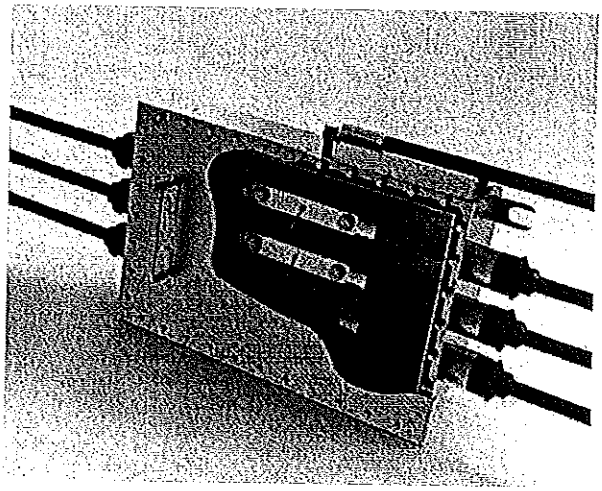
Technical specification:

- cross-bonding cable input is designed to prevent moisture from getting inside the box as well as to ensure that cable can be installed and removed from the box without taking a cable lug off;
- copper is a material of the cable conductor;
- a cable with conductor cross-section of 400 mm² is used.



Cross-bonding boxes

Cross-bonding boxes are designed for cross-connection of six single-core cables and for power transposition of HV cable screens when setting up 110 to 500 kV line.



Main components:

- stainless steel box with a sealed hood;
- sealed cable inputs;
- device housing earthing;
- surge arrester (standard, network, voltage 6 kV);
- insulators (standard, voltage rating 10 kV);
- copper buses for connection of insulators (for opening the circuit);
- sealed cable terminals to be crimped.

Calculated weight	66 kg
Protection grade	IP68

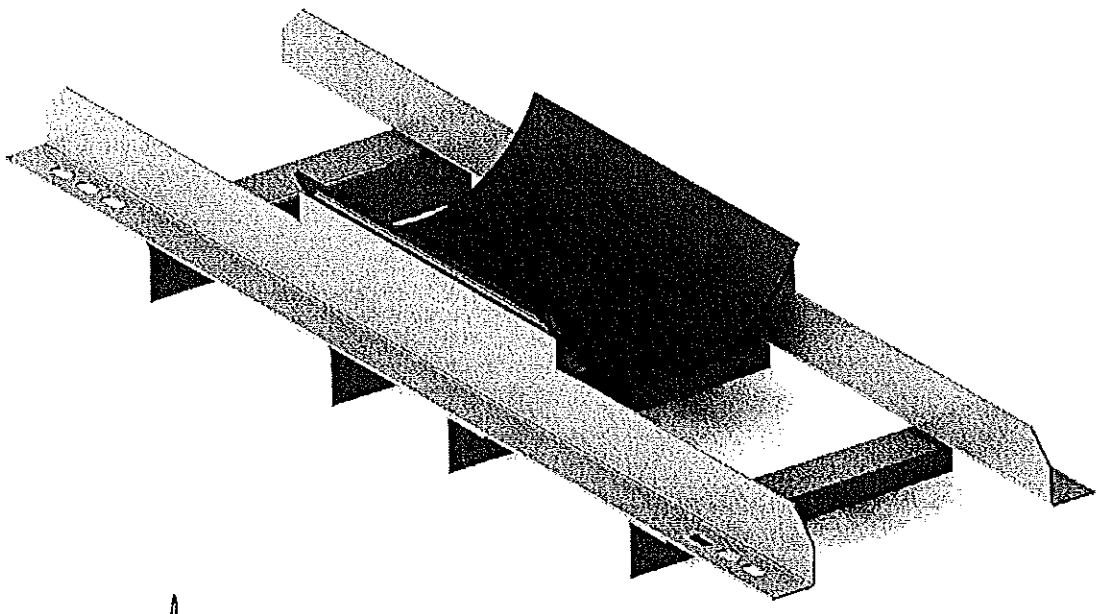
Installation:

- boxes are suitable for underground laying;
- the device design allows it to be installed both on a horizontal and vertical plane;
- the device can be fastened both directly on the floor/ wall and on a metal structure;
- the box can be fully submerged in water;
- a wire input is sealed using rubber gaskets and heat-shrinkable tubes;
- KTK construction allows to install the box in wells fitted with standard hatches per GOST 3634-89, with opening diameter D=600 mm, without dismantling the box and/or removing the hatch ring.

SUPPORT ASSEMBLY

Support assembly is designed for installation of joints.

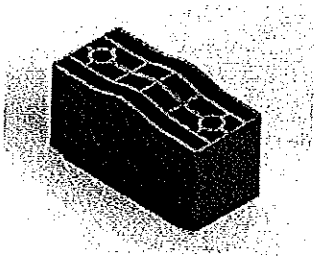
Support assembly consists of steel corners with supporting stand for installation of joints.



CABLE CLAMPS

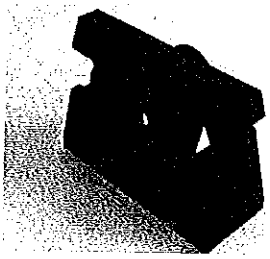
Application
Clamping of all types of medium, high and extra high voltage cables.

Cable clamps RKK series



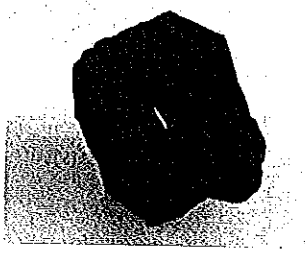
Type	Outer cable diameter
RKK-25/40	25 - 40 mm
RKK-40/60	40 - 60 mm

Cable clamps YKK3 series



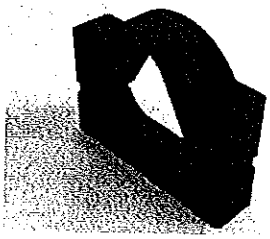
Type	Outer cable diameter
YKK-35/55	35 - 55 mm
YKK-40/70	40 - 70 mm

Cable clamps for voltage cables VKK series



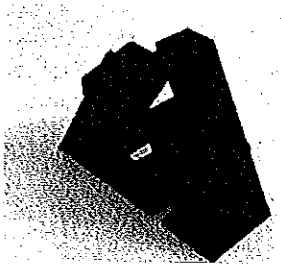
Type	Outer cable diameter
VKK-65/90	65 - 90 mm
VKK-85/105	85 - 105 mm
VKK-100/125	100 - 125 mm
VKK-125/150	125 - 150 mm
VKK-145/170	145 - 170 mm

Cable clamps for high voltage cables VKK3 series



Type	Outer cable diameter
VKK3-65/90	65 - 90 mm
VKK3-85/110	85 - 110 mm
VKK3-110/135	110 - 135 mm

YKK-60 Series

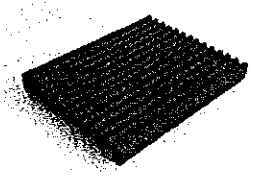


Type	Outer cable diameter
YKK-60,YKK2-60	30 - 40 mm

PST-80 (elastic inlay)

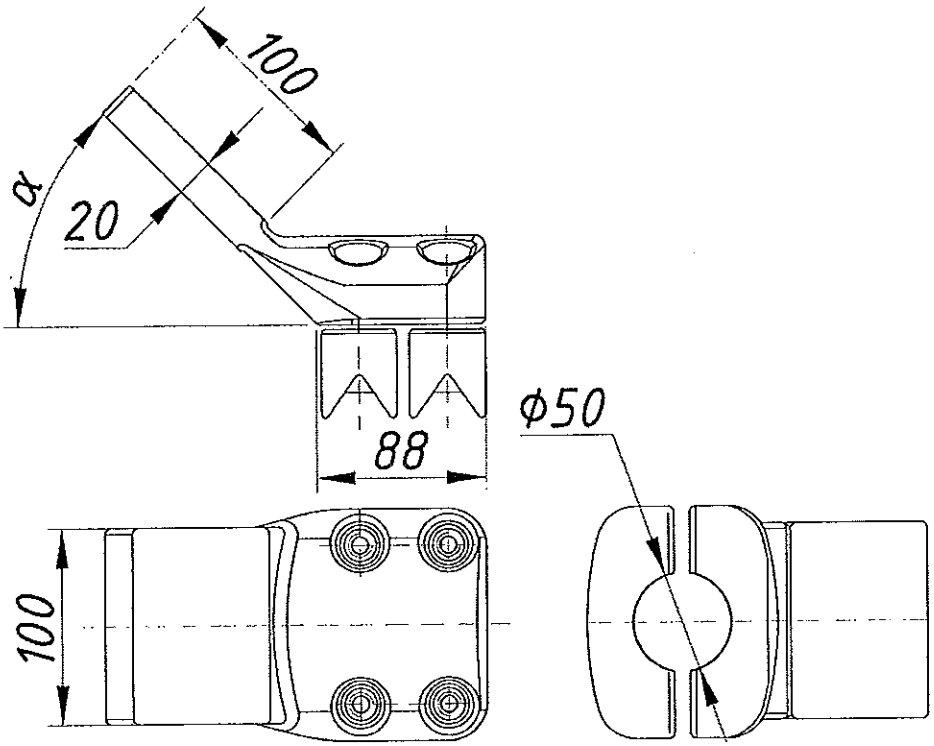
Application
Fixation of cables and support of weight in vertical installations.

Material
Silicone gasket is made of organosilicon.



CABLE CONNECTOR

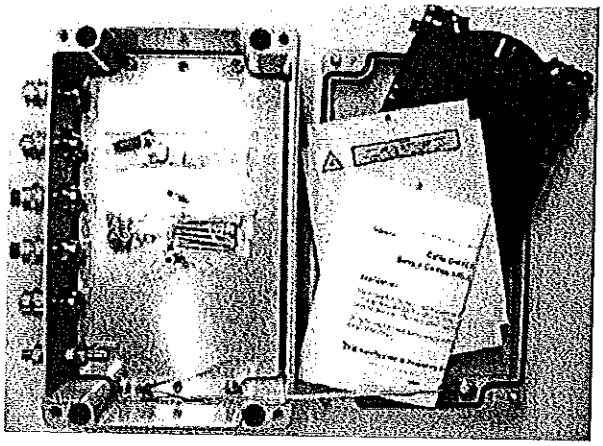
For connection of termination to cable lines it is necessary to use cable connectors. Arkasil SK delivers aluminium, bronze and bimetallic cable connectors.

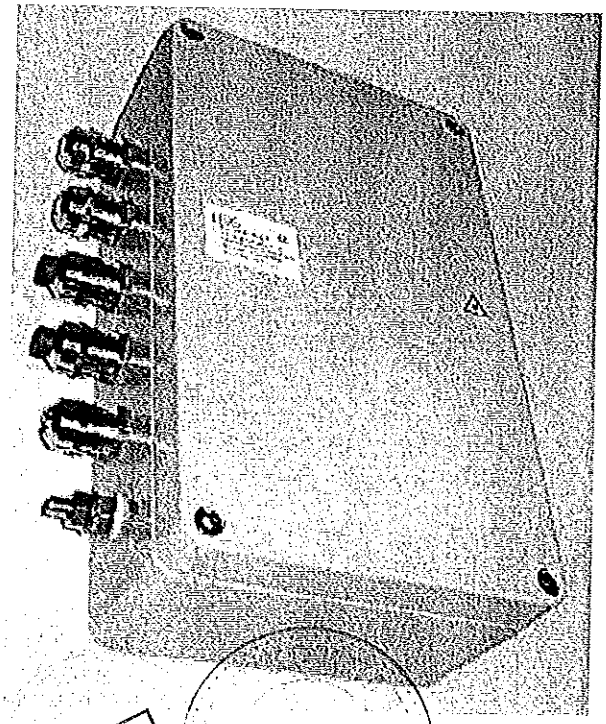


TERMINATION SPLICE BOX

It is applied for connection of fiber-optical modules installed in the high-voltage cables screens.

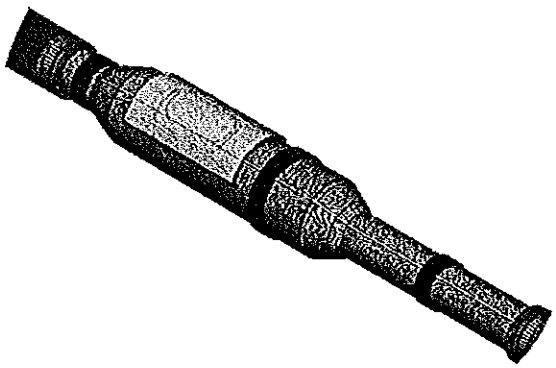
Splice box is a protective metal tray, safety class IP66, with 4 inputs for fiber-optical modules, 2,5 - 5,5 mm² in diameter. It protects the connection point and is applied to store the fiber stock necessary for repair or preventive works.

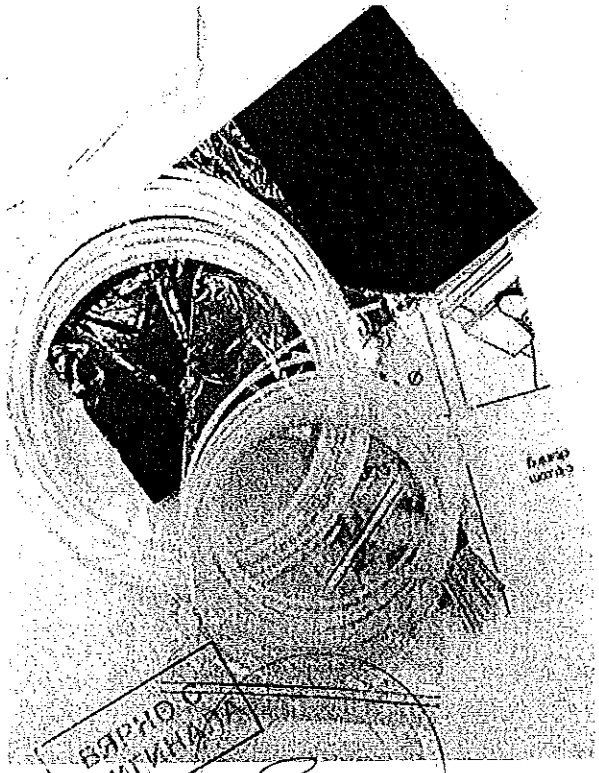




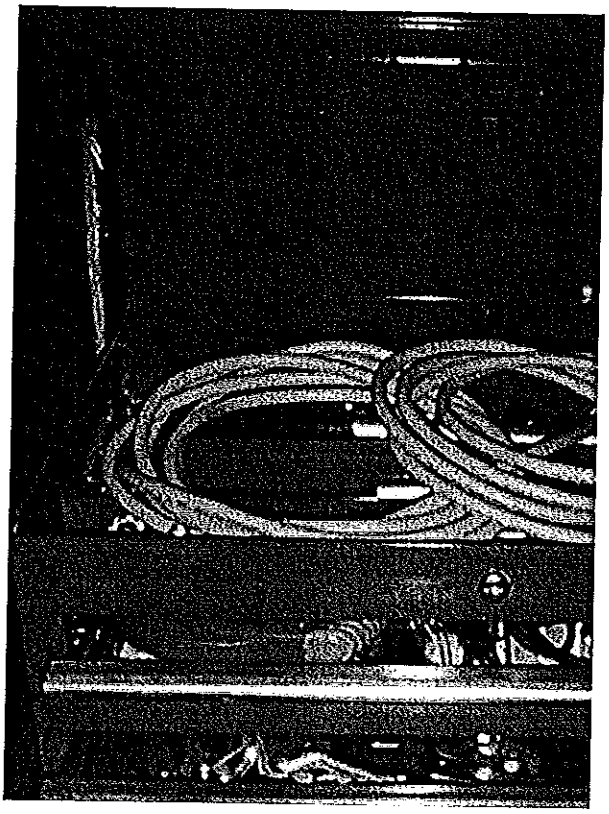
JOINT SPLICE BOX

It is applied for connection of fiber-optical modules installed in the high-voltage cables screens. A joint splice box is a protective rubber base with slots and channels for the optical fibers, it provides connection of the modules, protects the connection point. It is fixed during the joint installation. The supply complete set includes all necessary accessories for the optical modules welding.



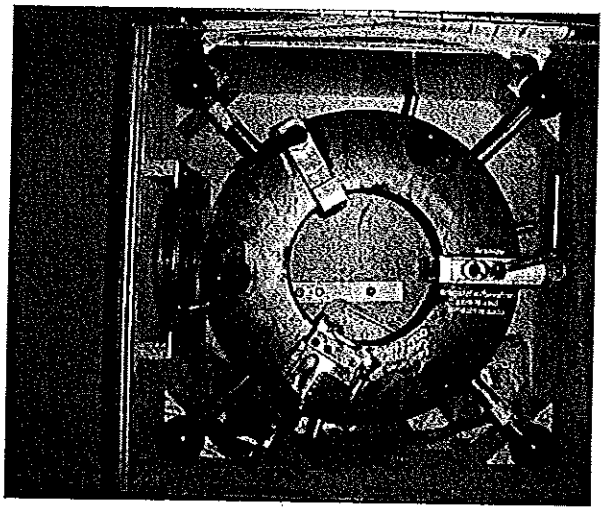


TOOLS FOR ARKASIL SK CABLE ACCESSORIES INSTALLATION



Installation Tool Kits
1010 Kit

The installation tools including all necessary items for the high-voltage cable and cable accessories preparation and installation.



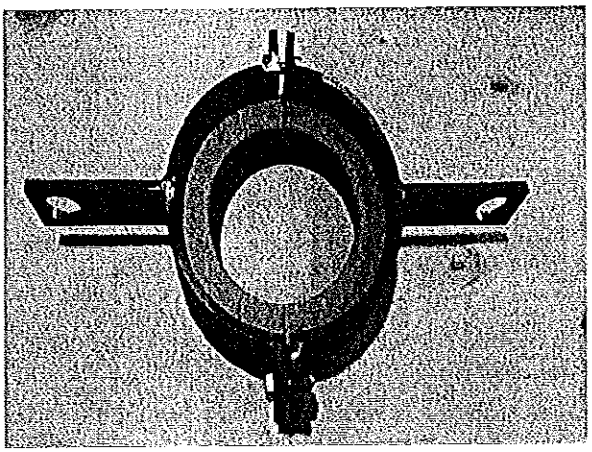
Unicut 30 Universal Cable Machine

For removal of the semi-conducting screen and insulation from the high-voltage cables, the 30mm-85mm diameter over insulation.

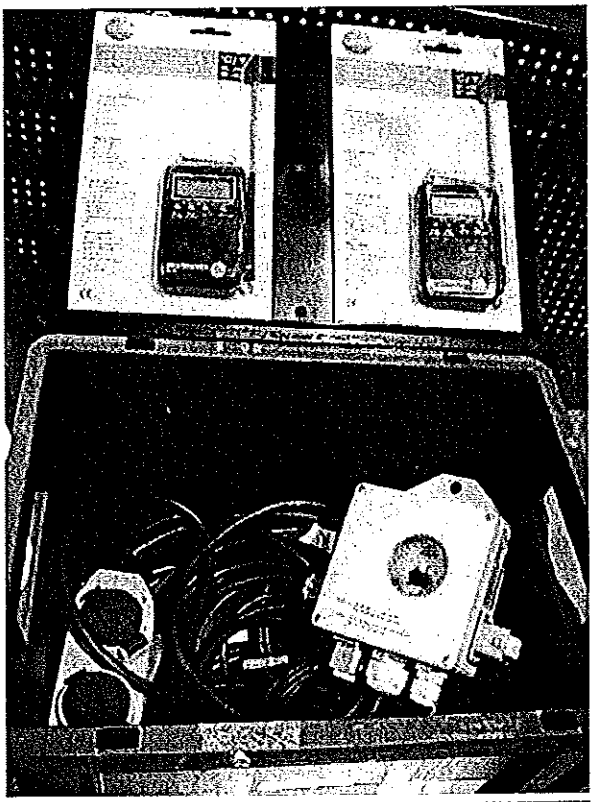
Unicut 40 Universal Cable Machine

For removal of the semi-conducting screen and insulation from the high-voltage cables, the 70mm-125mm diameter over insulation.

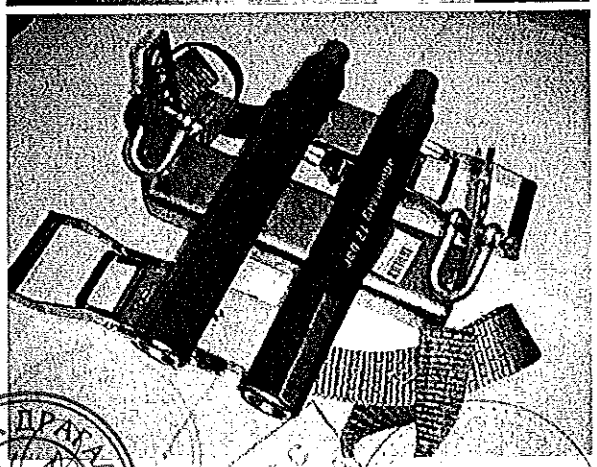
1000 kg Belt Winch
For pulling the silicon insulator on the cable.



Cable Heating Kit
1080 Kit
For the high-voltage cable heating. In addition, the kit shall include the temp and controlling instruments.

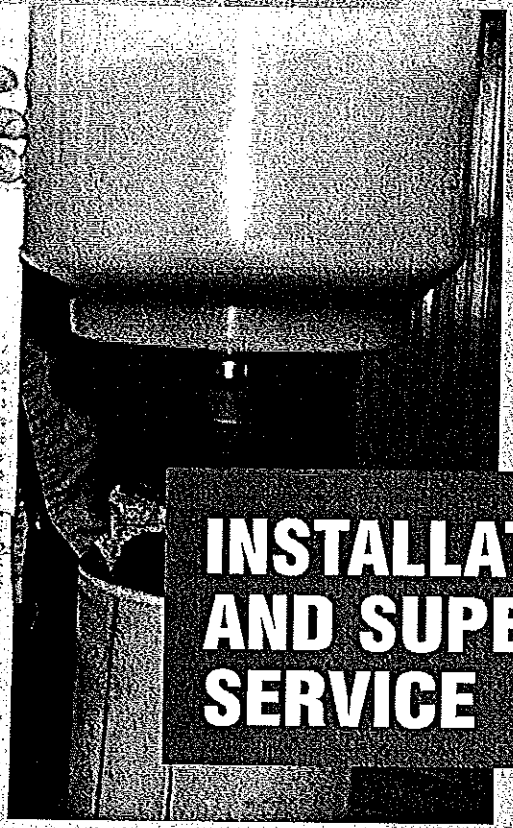


Winch-to-Cable Fixing Device
The device is fixed on the cable, and has terminals for fixing the winches.



Other Auxiliary and Installation Tools

Arkasil



INSTALLATION AND SUPERVISION SERVICE

SUPERVISION SERVICE

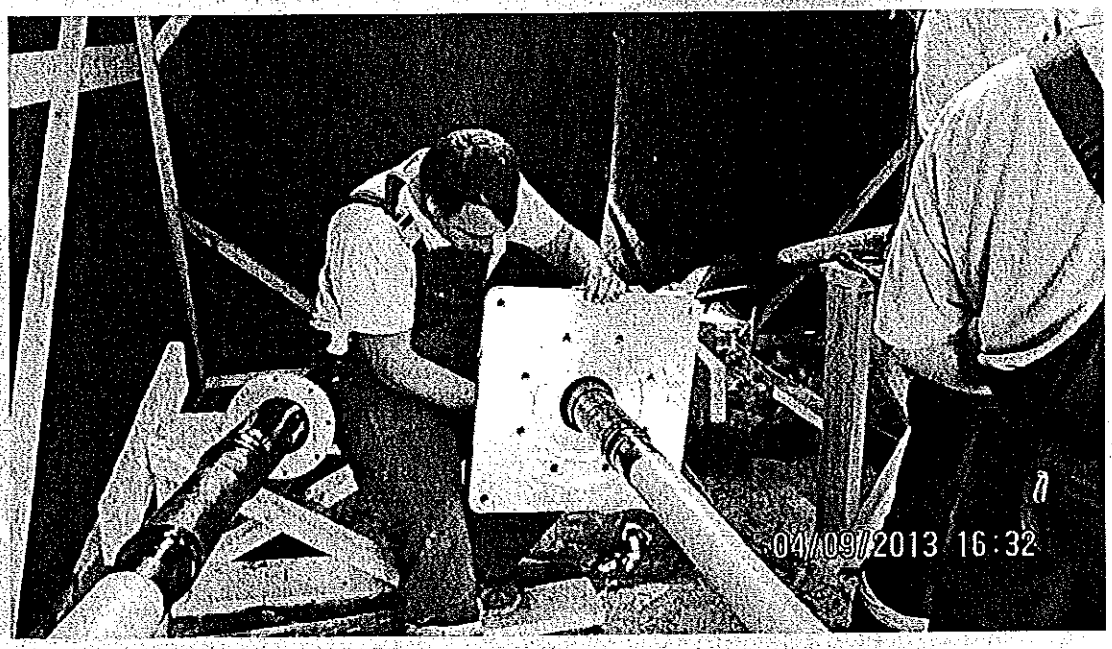
Arkasil SK renders services on installation and supervision of own high-voltage cable accessories. Our installation supervision services for the cable accessories shall mean:

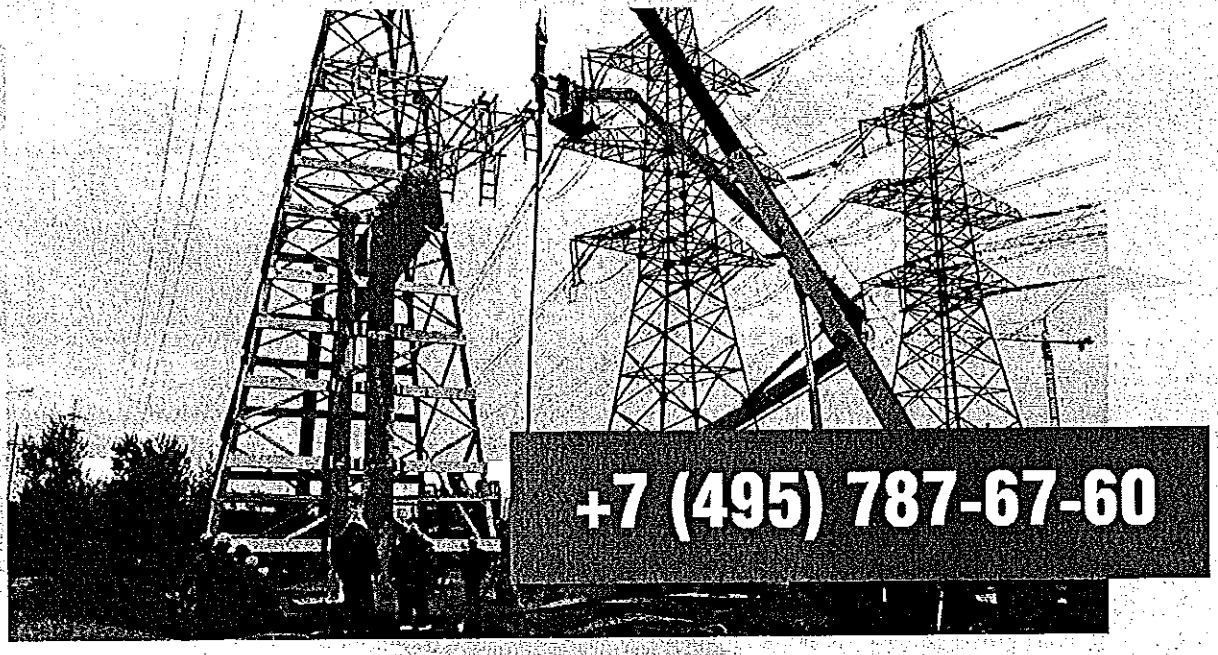
- multipurpose and process supervision;
- the works quality control of the personnel trained in Arkasil SK to installed cable accessories and who have special certificates;
- guarantee documentation on the installed Arkasil SK cable accessories;
- The Arkasil SK cable accessories related consultations;
- "Installation Supervision" in the construction standards is not defined yet. Therefore, when making an agreement, it is necessary to be governed by the normative documents, including "The Regulations For Installation/ Supervision", governing the bases for granting consulting services and the contractual relations, in general.

Arkasil

INSTALLATION SERVICE

- Installation of the Arkasil SK cable accessories by the specialists certified by Arkasil SK for these works.
- Guarantee documentation on the installed Arkasil SK cable accessories.
- The Arkasil SK cable accessories related consultations.





FOR MORE INFORMATION

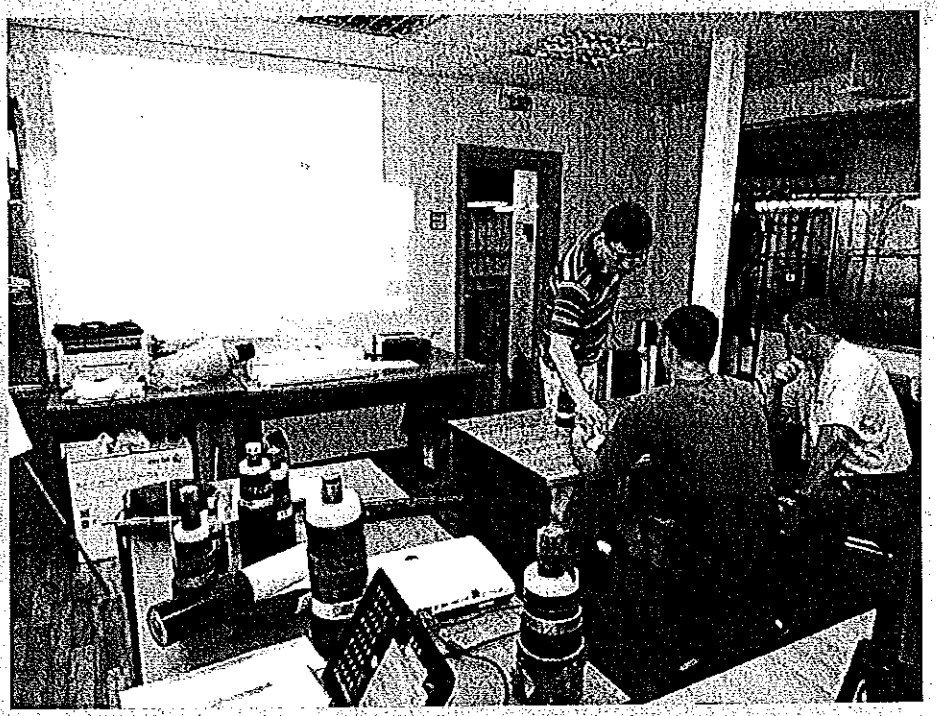
on the installation and supervision provided by Arkasil SK, please call: +7 (495) 787-67-60

363

Arkasil

INSTALLATION TRAINING

Arkasil SK arranges training for the installation contractor specialists. The training is arranged at the training center located at the Arkasil SK production facilities. There, for optimization of the educational process, Arkasil SK renders the training service at the installation contractor production facilities.



THE TRAINING SHALL INCLUDE

- Theory training
- Practical training
- Tests
