Qualified Electrical Engineering Personnel

Only qualified electrical engineering personnel may commission and operate the equipment (module, device) described in this document. Qualified electrical engineering personnel in the sense of this manual are people who can demonstrate technical qualifications as electrical technicians. These persons may commission, isolate, ground and label devices, systems and circuits according to the standards of safety engineering.

When electrical equipment is operated, hazardous voltages are inevitably present in certain parts. If proper action is not taken, death, severe injury or property damage can result:

- The equipment must be grounded at the grounding terminal before any connections are made.
- All circuit components connected to the power supply may be subject to dangerous voltage.
- Hazardous voltages may be present in equipment even after the supply voltage has been disconnected (capacitors can still be charged).
- Operation of equipment with exposed current-transformer circuits is prohibited. Before disconnecting the equipment, ensure that the current-transformer circuits are short-circuited.
- The limiting values stated in the document must not be exceeded. This must also be considered during testing and commissioning.

Dropout

The larger dropout differential ($= |\text{pickup value} - \text{dropout threshold}|$) of the following 2 criteria is used:

Dropout differential derived from the Dropout ratio parameter	
If this parameter is not available, a dropout ratio of 95 % applies to the overvoltage protection and a dropout ratio of 105 % applies to the undervoltage protection.	
Minimum absolute dropout differential	150 mV/sec.

Typical response times and maximum number of ticks of the CFC task levels:

Task Level	Time (in ms)	Ticks for Non-Modular Devices with CP100	Ticks for Modular Devices with CP200	Ticks for Modular Devices with CP300
Fast Event-Triggered	<1	500	500	1000
Event-Triggered	<10	12 367	12757	14702
Interlocking	<10	117 564 in total	121 537 in total	141 398 in total
Measurement	250			

The times describe the response time of a typical CFC chart at the respective task level. The maximum number of ticks applies to a typical load for the device based on the application template **Directional time-overcurrent protection, grounded electrical power system**. The maximum number can be lower in case of extensive protection applications.

The task level **Measurement** runs in cycles every 500 ms. All other task levels are event-triggered.

In order to estimate the tick consumption of a CFC chart, you can use the following formula:

$$T_{\text{chart}} = 5 \cdot n_{\text{inp}} + 5 \cdot n_{\text{outp}} + T_{\text{lev}} + \sum_i T_{\text{int}} + \sum_j T_{\text{block}}$$

where:

n_{inp} Number of indications routed as input in the CFC chart

n_{outp} Number of indications routed as output in the CFC chart

T_{lev} 101 Ticks in Fast Event-Triggered Level

104 Ticks in Event-Triggered Level

54 Ticks in Measurement Level

74 Ticks in Interlocking Level

T_{int} Number of internal connections between 2 CFC blocks in one chart

T_{block} Used ticks per CFC block (see Technical Data)
